TESTS

Solution S1

Dissolve 2.500 g in 50.0 ml of *carbon dioxide-free water R*.

Solution S2

pH *(2.2.3)*

Intrinsic viscosity

0.01 m^3/kg to 0.15 m^3/kg.

Test solution (a) Weigh 5.000 g (m_{0p}) of the substance to be examined and add about 80 ml of an 11.7 g/l solution of *sodium chloride R* at room temperature. Dissolve by shaking at room temperature for 30 min. Dilute to 100.0 ml with an 11.7 g/l solution of *sodium chloride R*. Filter through a 0.45 µm filter membrane and discard the first 10 ml. The concentration of test solution (a) is only indicative and must be adjusted after an initial measurement of the viscosity of test solution (a).

Test solution (b) To 15.0 ml of test solution (a) add 5.0 ml of an 11.7 g/l solution of *sodium chloride R.*

Test solution (c) To 10.0 ml of test solution (a) add 10.0 ml of an 11.7 g/l solution of *sodium chloride R*.

Test solution (d) To 5.0 ml of test solution (a) add 15.0 ml of an 11.7 g/l solution of *sodium chloride R.*

Determine the flow-time *(2.2.9)* for an 11.7 g/l solution of *sodium chloride R* (t_0) and the flow times for the 4 test solutions (t_1, t_2, t_3 and t_4), at 25.00 ± 0.03 °C. Use an appropriate suspended level viscometer (specifications: viscometer constant = about 0.005 mm^2/s^2, kinematic viscosity range = 1-5 mm^2/s, internal diameter of tube R = 0.53 mm, volume of bulb C = 5.6 ml, internal diameter of tube N = 2.8-3.2 mm) with a funnel-shaped lower capillary end. Use the same viscometer for all measurements; measure all outflow times in triplicate. The test is not valid unless the results do not differ by more than 0.35 per cent from the mean and if the flow time t_1 is not less than $1.6 \times t_0$ and not more than $1.8 \times t_0$. If this is not the case, adjust the concentration of test solution (a) and repeat the procedure.

Calculation of the relative viscosities Since the densities of the chondroitin sulphate solutions and of the solvent are almost equal, the relative viscosities η_{ri} (being η_{r1}, η_{r2}, η_{r3} and η_{r4}) can be calculated from the ratio of the flow times for the respective solutions t_i (being t_1, t_2, t_3 and t_4) to the flow time of the solvent t_0, but taking into account the kinetic energy correction factor for the capillary (B = 30 800 s^3), as shown below:

$$\frac{t_i - \frac{B}{t_i^2}}{t_0 - \frac{B}{t_0^2}}$$

Calculation of the concentrations Calculate the concentration c_1 (expressed in kg/m^3) of chondroitin sulphate sodium in test solution (a) using the following expression:

$$m_{0p} \times \frac{x}{100} \times \frac{100 - h}{100} \times 10$$

x = percentage content of chondroitin sulphate sodium as determined in the assay,

h = loss on drying as a percentage.

Calculate the concentration c_2 (expressed in kg/m^3) of chondroitin sulphate sodium in test solution (b) using the following expression:

$$c_1 \times 0.75$$

Calculate the concentration c_3 (expressed in kg/m^3) of chondroitin sulphate sodium in test solution (c) using the following expression:

$$c_1 \times 0.50$$

Calculate the concentration c_4 (expressed in kg/m^3) of chondroitin sulphate sodium in test solution (d) using the following expression:

$$c_1 \times 0.25$$

Calculation of the intrinsic viscosity The specific viscosity η_{s_i} of the test solution (being η_{s1}, η_{s2}, η_{s3} and η_{s4}) is calculated from the relative viscosities η_{ri} (being η_{r1}, η_{r2}, η_{r3} and η_{r4}) according to the following expression:

$$n_{r_i} \times 1$$

The intrinsic viscosity $[\eta]$, defined as

$$[\eta] = \lim_{c \to 0} \left(\frac{\eta_s}{c} \right)$$

is calculated by linear least-squares regression analysis using the following equation:

$$\frac{\eta_{si}}{c_i} = c_i \times k_H + [\eta]$$

c_i = concentration of the substance to be examined expressed in kg/m^3;

k_H = Huggins' constant.

Ph Eur

Chorionic Gonadotrophin

General Notices

(Ph Eur monograph 0498)

Action and use

Gonadotrophic hormone.

Preparation

Chorionic Gonadotrophin Injection

Ph Eur

DEFINITION

Chorionic gonadotrophin is a dry preparation of placental glycoproteins which have luteinising activity. The potency is not less than 2500 IU/mg.

PRODUCTION

Chorionic gonadotrophin is extracted from the urine of pregnant women using a suitable fractionation procedure. It is either dried under reduced pressure or freeze-dried.

CHARACTERS

Appearance

White to yellowish-white, amorphous powder.

Solubility

Soluble in water.

IDENTIFICATION

When administered to immature rats as prescribed in the assay, it causes an increase in the mass of the seminal vesicles and of the prostate gland.

TESTS

Water *(2.5.32)*

Maximum 5.0 per cent.

Bacterial endotoxins *(2.6.14)*

Less than 0.02 IU per IU of chorionic gonadotrophin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The potency of chorionic gonadotrophin is estimated by comparing under given conditions its effect of increasing the mass of the seminal vesicles (or the prostate gland) of immature rats with the same effect of the International Standard of chorionic gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of chorionic gonadotrophin from the urine of pregnant women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature male rats of the same strain, 19 to 28 days old, differing in age by not more than 3 days and having body masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 4 IU, 8 IU and 16 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 ml. Add a suitable antimicrobial preservative such as 4 g/l of phenol or 0.02 g/l of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group, on 4 consecutive days at the same time each day. On the fifth day, about 24 h after the last injection, euthanise the rats and remove the seminal vesicles. Remove any extraneous fluid and tissue and weigh the vesicles immediately. Calculate the results by the usual statistical methods, using the mass of the vesicles as the response. (The precision of the assay may be improved by a suitable correction of the organ mass with reference to the body mass of the animal from which it was taken; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight, tamper-proof container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

— the number of International Units per container,

— the potency in International Units per milligram.

The animals from which chymotrypsin is derived must fulfil the requirements for the health of animals suitable for human consumption. Furthermore, the tissues used shall not include any specified risk material as defined by any relevant international or, where appropriate, national legislation.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Histamine *(2.6.10)*

Not more than 1 µg (calculated as histamine base) per 5 microkatals of chymotrypsin activity. Before carrying out the test, heat the solution of the substance to be examined on a water-bath for 30 min.

In a depression in a white spot plate, mix 0.05 ml of this solution with 0.2 ml of the substrate solution (see Identification test A). No colour develops within 3 min of mixing.

TESTS

Solution S

Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution

Solution S is not more opalescent than reference suspension II *(2.2.1)*.

pH *(2.2.3)*

The pH of solution S is 3.0 to 5.0.

Absorbance *(2.2.25)*

Dissolve 30.0 mg in *0.001 M hydrochloric acid* and dilute to 100.0 ml with the same acid. The solution shows an absorption maximum at 281 nm and a minimum at 250 nm. The specific absorbance at the absorption maximum is 18.5 to 22.5 and at the absorption minimum is not greater than 8.

Loss on drying *(2.2.32)*

Not more than 5.0 per cent, determined on 0.100 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 2 h.

ASSAY

The activity of chymotrypsin is determined by comparing the rate at which it hydrolyses *acetyltyrosine ethyl ester R* with the rate at which *chymotrypsin BRP* hydrolyses the same substrate under the same conditions.

Apparatus Use a reaction vessel of about 30 ml capacity provided with:

— a device that will maintain a temperature of 25.0 ± 0.1 °C;

— a stirring device, for example a magnetic stirrer;

— a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. For the latter the burette is graduated in 0.005 ml and the pH meter is provided with a wide scale and glass-calomel or glass-silver-silver chloride electrodes.

Test solution Dissolve 25.0 mg of the substance to be examined in *0.001 M hydrochloric acid* and dilute to 250.0 ml with the same acid.

Reference solution Dissolve 25.0 mg of *chymotrypsin BRP* in *0.001 M hydrochloric acid* and dilute to 250.0 ml with the same acid.

Store the solutions at 0-5 °C. Warm 1 ml of each solution to about 25 °C over 15 min and use 50 µl of each solution (corresponding to about 25 nanokatals) for each titration. Carry out the titration in an atmosphere of nitrogen. Transfer 10.0 ml of *0.01 M calcium chloride solution R* to the reaction vessel and, while stirring, add 0.35 ml of *0.2 M acetyltyrosine ethyl ester solution R.* When the temperature is steady at 25.0 ± 0.1 °C (after about 5 min) adjust the pH to exactly 8.0 with *0.02 M sodium hydroxide*. Add 50 µl of the test solution (equivalent to about 5 µg of the substance to be examined) and start a timer. Maintain the pH at 8.0 by the addition of *0.02 M sodium hydroxide*, noting the volume added every 30 s. Calculate the volume of *0.02 M sodium hydroxide* used per second between 30 s and 210 s. Carry out a titration in the same manner using the reference solution and calculate the volume of *0.02 M sodium hydroxide* used per second.

Calculate the activity in microkatals per milligram using the following expression:

$$\frac{m' \times V}{m \times V'} \times A$$

m = mass of the substance to be examined, in milligrams,

m' = mass of *chymotrypsin BRP*, in milligrams,

V = volume of *0.02 M sodium hydroxide* used per second by the test solution,

V' = volume of *0.02 M sodium hydroxide* used per second by the reference solution,

A = activity of *chymotrypsin BRP*, in microkatals per milligram.

DEFINITION

Clobetasone butyrate contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 21-chloro-9-fluoro-16β-methyl-3,11,20-trioxopregna-1,4-dien-17-yl butanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, slightly soluble in alcohol.

It melts at about 178 °C.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry *(2.2.24)*, comparing with the spectrum obtained with *clobetasone butyrate CRS*. Examine the substances prepared as discs.

B. Examine by thin-layer chromatography *(2.2.27)*, using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a) Dissolve 10 mg of *clobetasone butyrate CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b) Dissolve 10 mg of *clobetasol propionate R* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *methyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The colour of the test solution is yellow and that of the blank is red.

TESTS

Specific optical rotation *(2.2.7)*

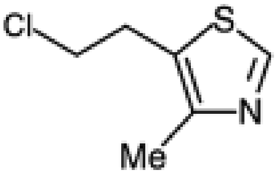
Clomethiazole

General Notices



C_6H_8ClNS 161.6 *533-45-9*

Action and use

Hypnotic.

Preparation

Clomethiazole Capsules

DEFINITION

Clomethiazole is 5-(2-chloroethyl)-4-methyl-thiazole. It contains not less than 98.0% and not more than 101.0% of C_6H_8ClNS.

CHARACTERISTICS

A colourless to slightly yellowish brown liquid.

Slightly soluble in *water*; miscible with *ethanol (96%)* and with *ether*.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.004% w/v solution in 0.1M *hydrochloric acid* exhibits a maximum only at 257 nm. The *absorbance* at the maximum is about 1.1.

B. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of clomethiazole *(RS 051)*.

C. Mix 0.1 g with 0.2 g of powdered *sodium hydroxide*, heat to fusion and continue heating for a further few seconds. Cool, add 0.5 ml of *water* and a slight excess of 2M *hydrochloric acid* and warm. Any fumes evolved do not turn moistened *starch iodate paper* blue (distinction from clomethiazole edisilate).

TESTS

Acidity or alkalinity

pH of a 0.5% w/v solution, 5.5 to 7.0, Appendix V L.

Heavy metals

Moisten the residue obtained in the test for Sulphated ash with 2 ml of *hydrochloric acid* and evaporate to dryness. Dissolve the residue in *water* and add sufficient *water* to produce 20 ml. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (1 ppm Pb)* to prepare the standard (20 ppm).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.20% w/v of the substance being examined in the mobile phase. For solution (2) dilute 1 volume of solution (1) to 1000 volumes with the mobile phase. For solution (3) dilute 1 volume of a 0.030% w/v solution of *4-methyl-5-vinylthiazole edisilate BPCRS* in *methanol* (solution A) to 50 volumes with the mobile phase. For solution (4) dilute 1 volume of a 0.020% w/v solution of *5-(2-chloroethyl)-4-methyl-3-[2-(4-methylthiazol-5-yl)ethyl]-thiazolium chloride BPCRS* (quaternary dimer) in *methanol* (solution B) to 50 volumes with the mobile phase. For solution (5) dilute 1 volume of a 0.020% w/v solution of *4-methyl-5-(2-hydroxyethyl)thiazole BPCRS* in *methanol* (solution C) to 50 volumes with the mobile phase. For solution (6) add 1 ml each of solutions A, B and C to 0.10 g of the substance being examined and dilute to 50 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute, a mixture of 70 volumes of a solution containing 0.13% w/v of *sodium hexanesulphonate* and 2.7% w/v of *tetramethylammonium hydrogen sulphate*, adjusted to pH 2.0 with 5M *sodium hydroxide*, and 30 volumes of *methanol* and (c) a detection wavelength of 257 nm.

The test is not valid unless in the chromatogram obtained with solution (6) baseline separation is achieved between the peaks due to the three specified impurities and also between the principal peak and the two adjacent specified impurity peaks.

Calculate the content of each of the three specified impurities in the substance being examined expressing the content of 4-methyl-5-vinylthiazole as the base (1 mg of 4-methyl-5-vinylthiazole edisilate is equivalent to 0.568 mg of base). The total content of the three specified impurities is not greater than 0.5%. In the chromatogram obtained with solution (1) the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2).

Sulphated ash

Not more than 0.1%, Appendix IX A. Use 1 g.

ASSAY

Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.3 g and determining the end point potentiometrically. Each ml of 0.1M *perchloric acid VS* is equivalent to 16.16 mg of C_6H_8ClNS.

STORAGE

Clomethiazole should be stored at a temperature of 2° to 8°.

It contains not less than 98.0% and not more than 101.0% of $C_{17}H_{21}NO_4$, calculated with reference to the dried substance.

CHARACTERISTICS

Colourless crystals or a white, crystalline powder. Slightly volatile.

Practically insoluble in *water*; freely soluble in *ethanol (96%)* and in *ether*; soluble in arachis oil; slightly soluble in *liquid paraffin*.

IDENTIFICATION

The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of cocaine *(RS 071)*.

TESTS

Melting point

96° to 98°, Appendix V A.

Specific optical rotation

In a 2.4 % w/v solution in 0.1M *hydrochloric acid*, -79 to -81, calculated with reference to the dried substance, Appendix V F.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution (1) contains 0.05% w/v of the substance being examined in the mobile phase. For solution (2) dilute 1 volume of solution (1) to 50 volumes with the mobile phase, dilute 5.0 ml of this solution to 100.0 ml with the mobile phase. For solution (3) dissolve 25 mg of the substance being examined in 0.01M *sodium hydroxide* and dilute to 100.0 ml with the same solvent. Allow the solution to stand for 15 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry is suitable) and maintained at 35°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution containing 1 volume of *triethylamine,* 200 volumes of *tetrahydrofuran,* 860 volumes of *acetonitrile* and 959 volumes of *water* and (c) a detection wavelength of 216 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cocaine (retention time, about 7 minutes) and the degradation product is at least 5.0.

In the chromatogram obtained with solution (1) the area of any peak eluting after the principal peak is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.1%) and the sum of the areas of any *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0. 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05 %).

Loss on drying

When dried to constant weight at 80°, loses not more than 0.5% of its weight, Appendix IX D. Use 1 g.

Sulphated ash

Not more than 0.1%, Appendix IX A.

ASSAY

Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.7 g dissolved in 50 ml of *1,4-dioxan* and *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 30.34 mg of $C_{17}H_{21}NO_4$.

STORAGE

Cocaine should be stored protected from light.

— injection of a mixture of equal amounts of *methyl palmitate R, methyl stearate R, methyl arachidate R* and *methyl behenate R* give area percentages of 24.4, 24.8, 25.2 and 25.6 (± 0.5 per cent), respectively,

— *resolution*: minimum of 1.3 between the peaks due to methyl oleate and methyl *cis*-vaccenate; the resolution between the pair due to methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.

Calculate the area per cent for each fatty acid methyl ester from the expression:

$$\frac{A_x}{A_t} \times 100$$

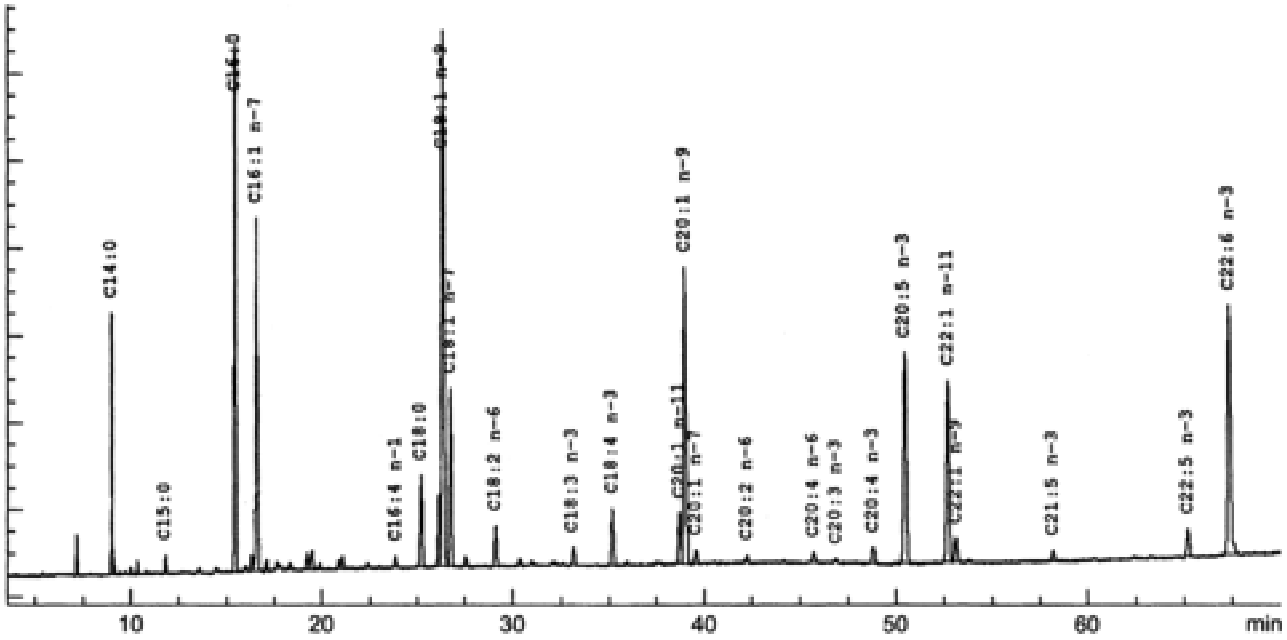

Figure 1192.-1. – *Chromatogram for the test for composition of fatty acids of cod-liver oil (type A)*

The calculation is not valid unless:

— the total area is based only on peaks due to solely fatty acids methyl esters,

— the number of fatty acid methyl ester peaks exceeding 0.05 per cent of the total area is at least 24,

— the 24 largest peaks of the methyl esters account for more than 90 per cent of the total area. ASSAY

Vitamin A

Carry out the test as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (for example, copper and iron) and acids.

Use method A. If method A is found not to be valid, use method B.

Method a

Ultraviolet absorption spectrophotometry *(2.2.25)*.

Test solution To 1.00 g in a round-bottomed flask, add 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R* and 30 ml of *ethanol R*. Boil under reflux in a current of *nitrogen R* for 30 min. Cool rapidly and add 30 ml of *water R*. Extract with 50 ml of *ether R*.

Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 ml, of *water R* and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol R1* to give an expected concentration of vitamin A equivalent to 10-15 IU/ml.

Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A, as all-*trans*-retinol, in International Units per gram from the expression:

$$A_{325} \times \frac{1830}{100m} \times V$$

A_{325} = absorbance at 325 nm,

m = mass of the substance to be examined, in grams,

V = total volume of solution containing 10-15 IU of vitamin A per millilitre,

1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

The above expression can be used only if A_{325} has a value of not greater than $A_{325,corr}/0.970$ where $A_{325,corr}$ is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325,\,corr} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325,corr}/0.970$, calculate the content of vitamin A from the following expression:

$$A_{325,\,corr} \times \frac{1830}{100m} \times V$$

The assay is not valid unless:

— the wavelength of maximum absorption lies between 323 nm and 327 nm,

— the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

Method b

Liquid chromatography *(2.2.29)*.

Test solution To 2.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R* and 10 ml of a freshly prepared 800 g/l solution of *potassium* *hydroxide R* and 100 ml of *ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent *V/V* solution of *ethanol R* and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 ml volumetric flask and dilute to 25 ml with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent of the unsaponifiable matter of cod-liver oil).

Reference solution (a) Prepare a solution of *retinol acetate CRS in 2-propanol R1* so that 1 ml contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry *(2.2.25).* Dilute reference solution (a) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) from the following expression, taking into account the assigned content of *retinol acetate CRS:*

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

V_1 = volume of reference solution (a) used,

V_2 = volume of the diluted solution,

1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

Reference solution (b) Proceed as described for the test solution but using 2.00 ml of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry *(2.2.25)*. Dilute reference solution (b) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml of all-*trans*-retinol and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b) from the expression:

$$A_{325} \times \frac{1830 \times V_3}{100 \times V_4}$$

A_{325} = absorbance at 325 nm,

V_3 = volume of the diluted solution,

V_4 = volume of reference solution (b) used,

1830 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

Injection 10 µl; inject in triplicate the test solution and reference solution (b).

Retention time All-*trans*-retinol = 5 ± 1 min.

— the chromatogram obtained with the test solution shows a peak due to that of all-*trans*-retinol in the chromatogram obtained with reference solution (b),

— when using the method of standard additions to the test solution there is greater than 95 per cent recovery of the added *retinol acetate CRS*,

— the recovery of all-*trans*-retinol in reference solution (b) as assessed by direct absorption spectrophotometry is greater than 95 per cent.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

A_1 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution,

A_2 = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in reference solution (a) as assessed prior to the saponification, in International Units per millilitre (= 1000 IU/ml),

V = volume of reference solution (a) treated (2.00 ml), *m* = mass of the substance to be examined in the test solution (2.00 g).

Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent *V/V* solution of *ethanol R*, and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. $$A_{325,\,\mathrm{corr}} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325,\mathrm{corr}}/0.970$, calculate the content of vitamin A from the expression:

$$A_{325,\,\mathrm{corr}} \times \frac{1830}{100m} \times V$$

The assay is not valid unless:

- the wavelength of maximum absorption lies between 323 nm and 327 nm,
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

Method B

Liquid chromatography *(2.2.29)*.

Test solution To 2.00 g in a round-bottomed flask, add 5 ml of a freshly prepared 100 g/l solution of *ascorbic acid R* and 10 ml of a freshly prepared 800 g/l solution of *potassium hydroxide R* and 100 ml of *ethanol R.* Boil under a reflux condenser on a water-bath for 15 min. Add 100 ml of a 10 g/l solution of *sodium chloride R* and cool. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 10 g/l solution of *sodium chloride R* and then with 150 ml of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 ml of a 30 g/l solution of *potassium hydroxide R* in a 10 per cent *V/V* solution of *ethanol R* and then with 3 quantities, each of 50 ml, of a 10 g/l solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulphate R* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R,* transfer to a 25 ml volumetric flask and dilute to 25 ml with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent of the unsaponifiable matter of cod-liver oil).

Reference solution (a) Prepare a solution of *retinol acetate CRS* in *2-propanol R1* so that 1 ml contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry *(2.2.25)*. Dilute reference solution (a) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) using the following expression, taking into account the assigned content of *retinol acetate CRS:*

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

Dilute reference solution (b) with *2-propanol R1* to a presumed concentration of 10-15 IU/ml of all-*trans*-retinol and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol R1* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b) from the expression:

Add 5 ml of *water R*, 20 ml of *anhydrous ethanol R*, 1 ml of *sodium ascorbate solution R* and 3 ml of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R*. Heat in a water-bath under a reflux condenser for 30 min. Cool rapidly under running water. Transfer the liquid to a separating funnel with the aid of 2 quantities, each of 15 ml, of *water R*, 1 quantity of 10 ml of *ethanol (96 per cent) R* and 2 quantities, each of 50 ml, of *pentane R*. Shake vigorously for 30 s. Allow to stand until the 2 layers are clear. Transfer the lower aqueous-alcoholic layer to a 2nd separating funnel and shake with a mixture of 10 ml of *ethanol (96 per cent) R* and 50 ml of *pentane R*. Wash the pentane layer with 2 quantities, each of 50 ml, of a freshly prepared 30 g/l solution of *potassium hydroxide R* in *ethanol (10 per cent V/V) R*, shaking vigorously, then wash with successive quantities, each of 50 ml, of *water R* until the washings are neutral to phenolphthalein. Transfer the washed pentane extract to a ground-glass-stoppered flask. Evaporate the contents of the flask to dryness under reduced pressure by swirling in a water-bath at 40 °C. Colestipol Hydrochloride

General Notices

37296-80-3

Action and use

Lipid-regulating drug.

Preparation

Colestipol Granules

DEFINITION

Colestipol Hydrochloride is a co-polymer of diethylenetriamine and 1-chloro-2,3-epoxypropane. Each g binds not less than 1.1 mEq and not more than 1.7 mEq of sodium cholate, determined in the test for Cholate binding capacity and calculated with reference to the dried material.

CHARACTERISTICS

Yellow to orange beads; hygroscopic.

Practically insoluble in *ethanol (96%)* and in *dichloromethane*; swells but does not dissolve in *water* and dilute aqueous solutions of acids and alkalis.

IDENTIFICATION

Carry out the method for *gas chromatography*, Appendix III B, using a suitable gas chromatograph fitted with a pyrolysis unit.

To prepare the sample, mix 1 part of n-*eicosane* and 4 parts of the substance being examined and grind the mixture in a mortar with *chloroform* until the substance being examined is uniformly coated with the *n*-eicosane. Prepare the standard in the same manner but adding 4 parts of *colestipol hydrochloride BPCRS* in place of the substance being examined. Load the sample and the standard separately into the pyrolysis unit.

The chromatographic procedure may be carried out using a glass column (1.8 m × 3 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) (Chromosorb W is suitable) coated with 0.25% w/w of *potassium hydroxide* and 5% w/w of *polyethylene glycol 20,000* (Carbowax 20M is suitable) maintained at about 85° with the detector at about 270°. The pyrolysis unit is capable of attaining a temperature of about 1000° when fitted with a platinum ribbon probe and using *helium* as the carrier gas with a flow rate of 60 ml per minute. Operate the unit in accordance with the manufacturer's instructions to obtain a pyrogram for *colestipol hydrochloride BPCRS* that is similar to that supplied with the reference material.

The pyrogram obtained with the substance being examined is concordant with that obtained with *colestipol hydrochloride BPCRS*.

TESTS

Acidity or alkalinity

Shake a 10% w/w suspension in a stoppered vial at approximately 10-minute intervals for 1 hour and centrifuge. Transfer a portion of the clear supernatant liquid to a suitable container and record the pH as soon as the reading has stabilised. The pH is 6.0 to 7.5, Appendix V L.

Water-soluble substances

Place 5 g in a glass-stoppered, 125 ml conical flask, add 80 ml of *water*, close the flask and shake in a water bath at 36° to 38° for 72 hours. Filter the contents of the flask through a fine-porosity, sintered glass funnel or woven glass-fibre filter, collecting the filtrate in a tared 125 ml conical flask. Rinse any residual contents in the flask with two 5 ml quantities of *water*, filter the washings and combine the filtrates from the washings with the filtrate obtained previously. Evaporate the filtrate to dryness, using filtered air or nitrogen, if necessary, to aid in the evaporation. Dry the residue at 75° at a pressure of not more than 2 kPa for 1 hour, allow to cool in a desiccator and weigh. Repeat the procedure at the same time without the substance being examined beginning at the words 'add 80 ml of *water* …'. The difference in the weights of the residues is not more than 25 mg (0.5%).

Heavy metals

Transfer 1.0 g to a suitable crucible, wet with *sulphuric acid* and carefully ignite at a low temperature until thoroughly charred. To the carbonised substance add 2 ml of *nitric acid* and 0.25 ml of *sulphuric acid* and heat cautiously until white fumes are no longer evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely removed and cool. Add 4 ml of 6M *hydrochloric acid*, cover, heat on a water bath for 15 minutes, uncover and slowly evaporate to dryness. Dissolve the residue using two 5 ml quantities of 2M *hydrochloric acid*. Add 0.1 ml of *phenolphthalein solution* and 13.5M *ammonia* drop wise until a pink colour is produced. Cool, add *glacial acetic acid* until the solution is decolourised and add a further 0.5 ml. Filter if necessary and dilute the solution to 20 ml with *water*. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII (20 ppm). Prepare the standard using a mixture of 2 ml of the test solution obtained above and 10 ml of *lead standard solution (2 ppm Pb)*.

Loss on drying

When dried at 75° at a pressure of not more than 2 kPa for 16 hours, loses not more than 1.0% of its weight.

Sulphated ash

Not more than 0.3%, Appendix IX A.

Chloride content

Not less than 6.5% and not more than 9.0% calculated with reference to the dried substance. Burn 20 mg by the method for *oxygen-flask combustion*, Appendix VIII C, using 10 ml of 0.05M *sodium hydroxide* as the absorbing liquid. When the process is complete shake the flask vigorously, allow to stand with frequent shaking for about 40 minutes or until no cloudiness is observed; add 20 ml of *ethanol (96%)* and 0.2 ml of *nitric acid*. Titrate the resulting solution with 0.05M *silver nitrate VS,* determining the end point potentiometrically using a silver-silver chloride electrode and a glass reference electrode (V ml). Repeat the procedure without the substance being examined adding 10 ml of 0.0075M *sodium chloride* to the solution in the flask (V_1 ml). Add 10 ml of 0.0075M *sodium chloride* to a flask containing a mixture of 10 ml of *water* and 20 ml of *ethanol (96%),* add 0.2 ml of *nitric acid* and titrate with

0.05M *silver nitrate VS*, determining the end point potentiometrically using a silver-silver chloride electrode and a glass reference electrode (V_2 ml). Determine the volume of 0.05M *silver nitrate VS* required by the substance being examined using the following expression:

$V-(V_1-V_2)$

Each ml of 0.05M *silver nitrate VS* is equivalent to 1.773 mg of Cl.

Water absorption capacity

Each g of Colestipol Hydrochloride absorbs not less than 3.3 g and not more than 5.3 g of *water* when determined in the following manner. Transfer 5 g to a dry, plastic container and add 80 g of *water*. Cover the container and allow the resulting suspension to equilibrate for 72 hours. Filter the resulting slurry through a medium-porosity fritted-glass funnel (KIMAX 60 ml-40M is suitable) at a pressure of 2kPa; collect the filtrate in a tared, plastic container, disconnecting the vacuum 2 minutes after collection of the last portion of the filtrate. Immediately weigh the container and the filtrate and determine the weight, in g, of the filtrate. Calculate the weight of water absorbed per g from the difference between the weight of the filtrate and the original weight of *water* used in the test.

Cholate binding capacity

Prepare a solution containing 1.0% w/v of *sodium cholate* and 0.9% w/v of *sodium chloride* and adjust to pH 6.4 by the drop wise addition of *hydrochloric acid* (solution A). Transfer 1 g (*m* g) of the substance being examined to a ground-glass-stoppered flask, add 100 ml of freshly prepared solution A and shake vigorously for 90 minutes with the flask positioned horizontally. Remove the flask from the shaker and allow the contents to settle for 5 minutes. Adjust the pH of a 20 ml aliquot of the supernatant liquid to 10.5 by the drop wise addition of 1M *sodium hydroxide* and titrate potentiometrically with 0.1M *hydrochloric acid* VS to the second inflection point of the pH curve. Determine the volume of titrant added between the inflection points. Carry out a blank titration on 20 ml of freshly prepared solution A. The difference between the titrations represents the amount of hydrochloric acid required (V ml). Calculate the cholate binding capacity of the substance being examined in milliequivalents from the expression $0.5V/m$.

Colestipol exchange capacity limit

Not less than 9.0 mEq per g and not more than 11.0 mEq per g determined in the following manner. Transfer not less than 2 g and 100 ml of 1M *sodium hydroxide* to a stoppered flask and shake for 4 hours. Filter the suspension through a coarse-porosity sintered-glass funnel and wash the resin with 500 ml of *water*. Transfer the resin to a 1000 ml beaker, add 200 ml of *water* and allow to stand for 10 minutes. Filter the suspension, check the pH of the filtrate and repeat the washing procedure with 200 ml quantities of *water* until the pH of the filtrate is less than 8 [5 litres may be required]. Dry the resin and funnel at 60^{c} at a pressure of 2 kPa for at least 16 hours, breaking up any aggregates with a spatula and store in a dessicator.

Place 1 g (*w* g) of the free base resin prepared above and add 100 ml of 0.2M *hydrochloric acid VS* in a stoppered flask and shake for not less than 2.5 hours. Filter a portion of the suspension through glass wool. Titrate 8 ml of the filtrate with 0.2M *sodium hydroxide VS*, determining the end point potentiometrically (*a* ml). Carry out a blank titration on 5 ml of the 0.2M *hydrochloric acid VS* used to equilibrate the free-base resin diluted with 5 ml of *water* (*b* ml). Calculate the exchange capacity in milliequivalents per g from the expression:

$(20/w)(b/5-a/8)$

Acidity

A 2.0% w/v solution is neutral to *bromocresol purple solution*.

Distillation range

Not more than 2% v/v distils below 188° and not less than 80% v/v distils between 195° and 205°, Appendix V C.

Weight per ml

1.029 to 1.044 g, Appendix V G.

Hydrocarbons

Place 50 ml in a 500 ml round-bottomed flask, add 150 ml of 5M *sodium hydroxide* and 30 ml of *water* and mix thoroughly. Connect the flask to a splash-bulb and air-condenser about 60 cm long, with the end of the air-condenser fitting closely into the neck of a 250 ml pear-shaped separating funnel and passing well into the separating funnel, which has a cylindrical graduated portion above the stopcock. Fill the graduated portion of the separating funnel with *water*. Distil rapidly until 75 ml of distillate has been collected, cooling the separating funnel in running water if necessary. Allow the separating funnel to stand in a vertical position until separation is complete and draw off the aqueous liquid into a titration flask for use in the test for Volatile bases.

Allow the separating funnel to stand for a few minutes, measure the volume of hydrocarbon oil in the graduated portion and warm, if necessary, to keep the oil in the liquid state. Subtract the volume of volatile bases in the hydrocarbon oil, as determined in the following test. Not more than 0.15% v/v of hydrocarbon oil is present.

Volatile bases

To the aqueous liquid reserved in the test for Hydrocarbons add any aqueous liquid still remaining in the separating funnel and neutralise, if necessary, with 0.1M *hydrochloric acid* using *phenolphthalein solution R1* as indicator. Titrate with 1M *hydrochloric acid VS* using *methyl orange solution* as indicator. Wash the oil from the separating funnel into the titration flask with *water* and again titrate with 1M *hydrochloric acid VS*. From the volume of additional 1M *hydrochloric acid VS*, calculate the proportion of volatile bases in the hydrocarbon oil. From the total volume of 1M *hydrochloric acid VS* used in both titrations calculate the volume of volatile bases in the substance being examined. Each ml of 1M *hydrochloric acid VS* is equivalent to 0.080 ml of volatile bases. Not more than 0.15% v/v of volatile bases is present.

Hydrocarbons and volatile bases

The sum of the contents of hydrocarbon oil and volatile bases, as determined in the tests for Hydrocarbons and for Volatile bases, does not exceed 0.25% v/v.

Sulphur compounds

Place 20 ml in a small conical flask and over the mouth of the flask fix a piece of filter paper moistened with a 10% w/v solution of *lead(II) acetate*. Heat the flask on a water bath for 5 minutes. Not more than a light yellow colour is produced on the filter paper.

Non-volatile matter

When evaporated on a water bath and dried at 105°, leaves not more than 0.1% w/v of residue.

STORAGE

Cresol should be protected from light. It darkens with age or on exposure to light.

Allow to stand for 24 h without shaking. Use the clear supernatant to prepare the test solution.

Prepare the reference solutions as follows: in a 100 ml volumetric flask, dissolve 0.100 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 100.0 ml with the same solvent; use the solution within 30 days; transfer 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of the solution to separate volumetric flasks, dilute the contents of each flask to 5.0 ml with *water R*, add 5 ml of *glacial acetic acid R*, dilute to 100.0 ml with *acetone R* and mix.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. If the solution is violet, add *0.1 M hydrochloric acid* in 1 ml portions until the solution becomes yellow, shaking after each addition. Titrate with *0.1 M sodium hydroxide* until the colour turns to violet.

Calculate the number of milliequivalents (*M*) of base required to neutralise the equivalent of 1 g of dried substance.

Calculate the degree of acid carboxymethyl substitution (*A*) using the following expression:

$$\frac{1150M}{(7102 - 412M - 80C)}$$

$$\frac{(162 + 58A)\,C}{(7102 - 80C)}$$

The degree of substitution is the sum of *A* and *S*.

DEFINITION

Crospovidone is a cross-linked homopolymer of 1-ethenylpyrrolidin-2-one. It is available in different degrees of powder fineness (type A and type B).

Content

11.0 per cent to 12.8 per cent of nitrogen (N; A_r 14.01) (dried substance).

CHARACTERS

Appearance

White or yellowish-white powder or flakes, hygroscopic.

Solubility

Practically insoluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry *(2.2.24)*.

Comparison Ph. Eur. reference spectrum of crospovidone.

B. Suspend 1 g in 10 ml of *water R*, add 0.1 ml of *0.05 M iodine* and shake for 30 s. Add 1 ml of *starch solution R* and shake. No blue colour develops within 30 s.

C. To 10 ml of *water R*, add 0.1 g and shake. A suspension is formed and no clear solution is obtained within 15 min.

D. Weigh a suitable quantity of the substance to be examined (for example 10 mg to 100 mg) and suspend it in 10.0 ml of *water R*, adding a wetting agent. Observe under a microscope at a suitable magnification using a calibrated ocular micrometer. If the majority of particles are in the range 50 µm to 300 µm, the product is classified as type A. If almost all the particles are below 50 µm, the product is classified as type B.

TESTS

Peroxides

Type A: maximum 400 ppm expressed as H_2O_2; type B: maximum 1000 ppm expressed as H_2O_2.

Suspend 2.0 g in 50 ml of *water R*. To 25 ml of this suspension add 2 ml of *titanium trichloride-sulphuric acid reagent R*. Allow to stand for 30 min and filter. The absorbance (*2.2.25*) of the filtrate, measured at 405 nm using a mixture of 25 ml of a filtered 40 g/l suspension of the substance to be examined and 2 ml of a 13 per cent *V/V* solution of *sulphuric acid R* as the compensation liquid has a maximum of 0.35.

For type B use 10 ml of the suspension diluted to 25 ml with *water R* for the test.

Water-soluble substances

Maximum 1.0 per cent.

Transfer 25.0 g to a 400 ml beaker, add 200 ml of *water R* and stir for 1 h using a magnetic stirrer. Transfer the suspension to a 250.0 ml volumetric flask, rinsing with *water R*, and dilute to volume with the same solvent. Allow the bulk of the solids to settle. Filter about 100 ml of the almost clear supernatant liquid through a 0.45 µm membrane filter, protected by superimposing a 3 µm membrane filter. While filtering, stir the liquid above the filter manually or by means of a mechanical stirrer, taking care not to damage the filter. Transfer 50.0 ml of the clear filtrate to a tared 100 ml beaker, evaporate to dryness and dry at 105-110 °C for 3 h. The residue weighs a maximum of 50 mg.

Impurity A

ASSAY

Place 100.0 mg of the substance to be examined (*m* mg) in a combustion flask, add 5 g of a mixture of 1 g of *copper sulphate R*, 1 g of *titanium dioxide R* and 33 g of *dipotassium sulphate R,* and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of *water R*. Add 7 ml of *sulphuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulphuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulphuric acid in the neck of the flask; precautions are to be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 45 min. Cool, dissolve the solid material by cautiously adding to the mixture 20 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution R* through the funnel, rinse the funnel cautiously with 10 ml of *water R* and distil immediately by passing steam through the mixture. Collect 80-100 ml of distillate in a mixture of 30 ml of a 40 g/l solution of *boric acid R* and 0.05 ml of *bromocresol green-methyl red solution R* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation lower the receiver so that the tip of the condenser is above the surface of the acid solution and rinse the end part of the condenser with a small quantity of *water R*. Titrate the distillate with *0.025 M sulphuric acid* until the colour of the solution changes from green through pale greyish-blue to pale greyish-red-purple (n_1 ml of *0.025 M sulphuric acid*).

Repeat the test using about 100 mg of *glucose R* in place of the substance to be examined (n_2 ml of *0.025 M sulphuric acid*).

Dispersible Cellulose

General Notices

Action and use

Pharmaceutical excipient.

DEFINITION

Dispersible Cellulose is a colloid-forming, attrited mixture of Microcrystalline Cellulose and Carmellose Sodium.

Content of carmellose sodium

75.0 to 125.0% w/w of the stated amount.

CHARACTERISTICS

A white or off-white, coarse or fine powder.

Disperses in *water* producing a white, opaque dispersion or gel; practically insoluble in organic solvents and in dilute acids.

IDENTIFICATION

A. Mix 6 g with 300 ml of *water* stirring at 18,000 revolutions per minute for 5 minutes. A white, opaque dispersion is obtained which does not produce a supernatant liquid.

B. Add several drops of the dispersion obtained in test A to a 10% w/v solution of *aluminium chloride*. Each drop forms a white, opaque globule which does not disperse on standing.

C. Add 2 ml of *iodinated potassium iodide solution* to the dispersion obtained in test A. No blue or purplish colour is produced.

D. The solution obtained in the test for Heavy metals yields the reactions characteristic of *sodium salts* , Appendix VI, except that in test A the white precipitate produced may not be dense.

TESTS

Acidity or alkalinity

pH of the dispersion obtained in the test for Apparent viscosity, 6.0 to 8.0, Appendix V L.

Solubility

Add 50 mg to 10 ml of *ammoniacal solution of copper tetrammine* and shake. It dissolves completely leaving no residue.

Apparent viscosity

60 to 140% of the declared value when determined by the following method. Calculate the quantity (*x* g) needed to prepare exactly 600 g of a dispersion of the stated percentage w/w, with reference to the dried substance. To (600-*x*) g of *water* at 23° to 25° contained in a 1000 ml high-speed blender bowl add *x* g of the substance being examined, stirring at reduced speed, taking care to avoid contacting the sides of the bowl with the powder. Continue stirring at low speed for 15 seconds after the addition and then stir at 18,000 revolutions per minute for exactly 2 minutes. Immerse the appropriate spindle of a rotational viscometer, switch on after 30 seconds and after a further 30 seconds determine the *viscosity*, Appendix V H, Method III, using a speed of 20 revolutions per minute (2.09 radians per second).

Heavy metals

To the residue obtained in the test for Sulphated ash add 1 ml of *hydrochloric acid*, evaporate to dryness on a water bath and dissolve the residue in 20 ml of *water*. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (1 ppm) Pb* to prepare the standard (10 ppm).

Loss on drying

When dried to constant weight at 105°, loses not more than 8.0% of its weight. Use 1 g.

Sulphated ash

Not more than 5.0%, Appendix IX A. Use 2 g.

ASSAY

Heat 2 g with 75 ml of *anhydrous acetic acid* under a reflux condenser for 2 hours, cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, determining the end point potentiometrically. Each ml of 0.1M *perchloric acid VS* is equivalent to 29.6 mg of carmellose sodium.

STORAGE

Dispersible Cellulose should be stored at a temperature of 8° to 15°.

LABELLING

The label states (1) the percentage w/w of Carmellose Sodium; (2) the viscosity of a dispersion in water of a stated percentage w/w of Carmellose Sodium.

General Notices

Exsiccated Calcium Sulphate; Plaster of Paris

$CaSO_4,½H_2O$ 145.1 *26499-65-0*

DEFINITION

Dried Calcium Sulphate is prepared by heating powdered gypsum, $CaSO_4,2H_2O$, at about 150° in a controlled manner such that it is substantially converted into the hemihydrate, $CaSO_4,½H_2O$, with minimum production of the anhydrous phases of calcium sulphate. It may contain suitable setting accelerators or decelerators.

CHARACTERISTICS

A white or almost white powder; hygroscopic.

Slightly soluble in *water*; more soluble in dilute mineral acids; practically insoluble in *ethanol (96%)* .

IDENTIFICATION

Yields the reactions characteristic of *calcium salts* and of *sulphates* , Appendix VI.

TESTS

Setting properties

20 g mixed with 10 ml of *water* at 15° to 20° in a cylindrical mould about 2.4 cm in diameter sets in 4 to 11 minutes. The mass thus produced, after standing for 3 hours, possesses sufficient hardness to resist pressure of the fingers at the edges, which retain their sharpness of outline and do not crumble.

Loss on ignition

When ignited to constant weight at red heat, loses 4.5% to 8.0% of its weight. Use 1 g.

Inject 1 µl of test solution (a) and 1 µl of test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio *r* using the following expression:

$$\frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (b);

S_i = area of the peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a).

If *r* is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak due to the internal standard in the chromatogram obtained with test solution (a) using the following expression:

$$S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak due to the internal standard in the chromatogram obtained with test solution (a);

S_c = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject, under the same conditions, equal volumes of the reference solution and of test solution (a). Identify the peaks in the chromatogram obtained with test solution (a) by comparing their retention times with those of the peaks in the chromatogram obtained with the reference solution and determine the area of each peak.

Calculate the percentage content of cetyl alcohol using the following expression:

$$S_A \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_A = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (a);

m_H = mass of the internal standard in test solution (a), in milligrams;

$S_{Ha(corr)}$ = corrected area of the peak due to the internal standard in the chromatogram obtained with test solution (a);

m = mass of the substance to be examined in test solution (a), in milligrams.

Calculate the percentage content of stearyl alcohol using the following expression:

$$S_B \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_B = area of the peak due to stearyl alcohol in the chromatogram obtained with test solution (a).

The percentage content of cetostearyl alcohol corresponds to the sum of the percentage content of cetyl alcohol and of stearyl alcohol.

Column	0 - 20	150 → 250
Injection port		250
Detector		250

Detection Flame ionisation.

Elution order Cetyl alcohol, heptadecanol, stearyl alcohol.

Inject 1 µl of test solution (a) and 1 µl of test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio *r* using the following expression:

$$\frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (b);

S_i = area of the peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a).

If r is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak due to the internal standard in the chromatogram obtained with test solution (a) using the following expression:

$$S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak due to the internal standard in the chromatogram obtained with test solution (a);

S_c = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject, under the same conditions, equal volumes of the reference solution and of test solution (a). Identify the peaks in the chromatogram obtained with test solution (a) by comparing their retention times with those of the peaks in the chromatogram obtained with the reference solution and determine the area of each peak.

Calculate the percentage content of cetyl alcohol using the following expression:

$$S_A \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_A = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (a);

m_H = mass of the internal standard in test solution (a), in milligrams;

$S_{Ha(corr)}$ = corrected area of the peak due to the internal standard in the chromatogram obtained with test solution (a);

m = mass of the substance to be examined in test solution (a), in milligrams.

Calculate the percentage content of stearyl alcohol using the following expression:

$$S_B \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S_B = area of the peak due to stearyl alcohol in the chromatogram obtained with test solution (a).

The percentage content of cetostearyl alcohol corresponds to the sum of the percentage content of cetyl alcohol and of stearyl alcohol.

The following characteristics may be relevant for microcrystalline cellulose and carmellose sodium used as a suspending agent.

Apparent viscosity *(2.2.10)*

60 per cent to 140 per cent of the nominal value.

Calculate the quantity (x g) needed to prepare exactly 600 g of a dispersion of the stated percentage *m/m* (dried substance). To (600 - x) g of *water R* at 23-25 °C contained in a 1000 ml high-speed blender bowl add x g of the substance to be examined and stir at reduced speed, taking care to avoid contacting the sides of the bowl with the powder. Continue stirring at low speed for 15 s after the addition of the powder and then stir at 18 000 r/min for exactly 2 min.

Determine the viscosity with a suitable relative rotational viscometer under the following conditions:

- — spindle: as appropriate;
- — speed: 20 r/min.

Immerse the spindle into the suspension immediately after preparation, switch on the rotation spindle after 30 s, after a further 30 s take scale readings and calculate the viscosity according to the viscometer manual.

Action and use

DEFINITION

Purified, partly depolymerised cellulose prepared by treating alpha-cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

CHARACTERS

Appearance

White or almost white, fine or granular powder.

Solubility

Practically insoluble in water, in acetone, in anhydrous ethanol, in toluene, in dilute acids and in a 50 g/l solution of sodium hydroxide.

IDENTIFICATION

A. Place about 10 mg on a watch-glass and disperse in 2 ml of *iodinated zinc chloride solution R*. The substance becomes violet-blue.

B. The degree of polymerisation is not more than 350.

Transfer 1.300 g to a 125 ml conical flask. Add 25.0 ml of *water R* and 25.0 ml of *cupriethylenediamine hydroxide solution R*. Immediately purge the solution with *nitrogen R*, insert the stopper and shake until completely dissolved. Transfer an appropriate volume of the solution to a suitable capillary viscometer *(2.2.9)*. Equilibrate the solution at 25 ± 0.1 °C for at least 5 min. Record the flow time (t_1) in seconds between the 2 marks on the viscometer. Calculate the kinematic viscosity (ν_1) of the solution using the following expression:

$$t_1 (k_1)$$

where k_1 is the viscometer constant.

Dilute a suitable volume of *cupriethylenediamine hydroxide solution R* with an equal volume of *water R* and measure the flow time (t_2) using a suitable capillary viscometer. Calculate the kinematic viscosity (ν_2) of the solvent using the following expression:

$$t_2 (k_2)$$

where k_2 is the viscometer constant.

Determine the relative viscosity (η_{rel}) of the substance to be examined using the following expression:

$$v_1 / v_2$$

Determine the intrinsic viscosity ($[\eta]_c$) by interpolation, using the intrinsic viscosity table (Table 0316.-1).

Calculate the degree of polymerisation (P) using the following expression:

$$\frac{95\,[\eta]_c}{m\,[(100 - b)/100]}$$

where m is the mass in grams of the substance to be examined and b is the loss on drying as a percentage.

TESTS

Solubility

Dissolve 50 mg in 10 ml of *ammoniacal solution of copper tetrammine R*. It dissolves completely, leaving no residue.

pH *(2.2.3)*

5.0 to 7.5 for the supernatant liquid.

Shake 5 g with 40 ml of *carbon dioxide-free water R* for 20 min and centrifuge.

Conductivity *(2.2.38)*

The conductivity of the test solution does not exceed the conductivity of the water by more than 75 µS·cm^{-1}.

Use as test solution the supernatant liquid obtained in the test for pH. Measure the conductivity of the supernatant liquid after a stable reading has been obtained and measure the conductivity of the water used to prepare the test solution.

Ether-soluble substances

Maximum 0.05 per cent (5 mg) for the difference between the weight of the residue and the weight obtained from a blank determination.

Place 10.0 g in a chromatography column about 20 mm in internal diameter and pass 50 ml of *peroxide-free ether R* through the column. Evaporate the eluate to dryness. Dry the residue at 105 °C for 30 min, allow to cool in a dessicator and weigh. Carry out a blank determination.

Water-soluble substances

Maximum 0.25 per cent (12.5 mg) for the difference between the mass of the residue and the mass obtained from a blank determination.

Shake 5.0 g with 80 ml of *water R* for 10 min. Filter through a filter paper with the aid of vacuum into a tared flask. Evaporate to dryness on a water-bath avoiding charring. Dry at 105 °C for 1 h and weigh. Carry out a blank determination.

Heavy metals *(2.4.8)*

Maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R* .

Loss on drying *(2.2.32)*

Maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash *(2.4.14)*

Maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^3 micro-organisms per gram and with a limit for fungi of 10^2 per gram, determined by plate count. It complies with the tests for *Escherichia coli* , for *Pseudomonas aeruginosa* , for *Staphylococcus aureus* and for

Salmonella (2.6.13) .

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for microcrystalline cellulose used as binder, diluent or disintegrant.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited they are recognised as being suitable for the purpose but other *methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

The following characteristics may be relevant for powdered cellulose used as diluent or disintegrant.

Strong Cetrimide Solution

General Notices

Action and use

Antiseptic.

Preparation

Cetrimide Solution

DEFINITION

Strong Cetrimide Solution is an aqueous solution of cetrimide. It contains 20 to 40% w/v of cetrimide, calculated as $C_{17}H_{38}BrN$. It contains Ethanol (96 per cent) or Isopropyl Alcohol or both. It may be perfumed and may contain colouring matter.

PRODUCTION

In making Strong Cetrimide Solution, Ethanol (96 per cent) may be replaced by Industrial Methylated Spirit, provided that the law and the statutory regulations governing the use of Industrial Methylated Spirit are observed.

Content of cetrimide $C_{17}H_{38}BrN$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the solution containing 0.1 g of cetrimide to 5 ml with *water* and add 2 ml of a 5% w/v solution of *potassium hexacyanoferrate(III)*. A yellow precipitate is produced.

B. Shake together 5 ml of *water*, 1 ml of 2M *sulphuric acid* , 2 ml of *chloroform* and 0.05 ml of *methyl orange solution*; the chloroform layer is colourless. Add 0.1 ml of the solution being examined and shake; a yellow colour is produced slowly in the chloroform layer.

C. Yields reaction A characteristic of *bromides*, Appendix VI.

TESTS

Acidity or alkalinity

Dilute a volume of the solution containing 10 g of cetrimide to 100 ml and add 0.1 ml of *bromocresol purple solution*. Not more than 1.0 ml of either 0.1M *hydrochloric acid VS* or 0.1M *sodium hydroxide VS* is required to change the colour of the solution.

Miscibility with ethanol

Mix a volume of the solution containing 1.6 g of cetrimide with a mixture of 2 ml of *water* and 16 ml of *ethanol (96%)*. The solution remains *clear*, Appendix IV A.

Neutral substances

To a volume of the solution containing 10 g of cetrimide add 25 ml of *ethanol (50%)*, acidify to *bromophenol blue solution* by the drop wise addition of *hydrochloric acid* and add 0.05 ml in excess. Transfer quantitatively to the extraction compartment of an apparatus designed for continuous liquid-liquid extraction by fluids of a lesser density than water, washing out the beaker with 10 ml *ethanol (50%)* and adding the washings to the bulk of the solution in the extractor. Add sufficient *ethanol (50%)*, if necessary, to half-fill the extraction chamber to the level of the overflow limb. Add sufficient *purified hexane* to fill the extraction chamber, secure an overflow volume of about 30 ml in the ebullition flask and heat using an electrically heated mantle. Ensure that a continuous flow of hexane through the aqueous ethanol layer is observed and continue the extraction for 16 hours. Transfer the hexane extract to a separating funnel, washing out the flask with 10 ml of *purified hexane*. Shake the combined extract and washings with 25 ml of *ethanol (50%)* and discard the aqueous ethanol layer. Filter the hexane layer through a dry filter paper (Whatman No. 1 is suitable) into a tared flask and remove the solvent using a rotary evaporator at 40° and then at room temperature at a pressure not exceeding 0.7 kPa for 2 hours. The residue weighs not more than 0.4 g.

Non-quaternised amines

To a volume of the solution containing 10 g of cetrimide add a mixture of 100 ml of *propan-2-ol*, 0.1 ml of *hydrochloric acid* and 20 ml of *methanol*. Titrate with 0.1M *tetrabutylammonium hydroxide VS* passing a slow current of *nitrogen* through the solution and determining the end point potentiometrically using a platinum-glass electrode system. Inflections in the titration curve indicate (A) neutralisation of excess hydrochloric acid and (B) neutralisation of non-quaternised amine salts. The difference between the volumes corresponding to A and B is not more than 10 ml (2.4%, calculated as $C_{16}H_{35}N$).

Ethanol; Isopropyl alcohol

Carry out one or both of the following methods according to the declared alcohol content of the solution being examined.

Ethanol Not more than 10.0% v/v, by the method for the *determination of ethanol*, Appendix VIII F. Use on-column injection and do not heat the injection port.

Isopropyl alcohol Not more than 10.0% v/v, by the method for the *determination of ethanol*, Appendix VIII F, with the following modifications. For solution (1) use a solution containing 5.0% v/v of *propan-2-ol* and 5.0% v/v of *propan-1-ol* (internal standard). For solution (2) use the solution being examined, diluted with *water*, if necessary, to contain about 5.0% v/v of isopropyl alcohol. Maintain the column temperature at 170°, use on-column injection and do not heat the injection port.

ASSAY

Dilute a volume containing 4 g of cetrimide with sufficient *water* to produce 100 ml. Transfer 25 ml of the solution to a separating funnel and add 25 ml of *chloroform*, 10 ml of 0.1M *sodium hydroxide* and 10 ml of a freshly prepared 8.0% w/v solution of *potassium iodide*. Shake well, allow to separate and discard the chloroform layer. Wash the aqueous layer with three 10 ml quantities of *chloroform* and discard the washings. Add 40 ml of *hydrochloric acid*, cool and titrate with 0.05M *potassium iodate VS* until the deep brown colour is almost discharged. Add 2 ml of *chloroform* and continue the titration, with shaking, until the chloroform layer becomes colourless. Carry out a blank titration on a mixture of 10 ml of the freshly prepared potassium iodide solution, 20 ml of *water* and 40 ml of *hydrochloric acid*. The difference between the titrations represents the amount of potassium iodate required. Each ml of 0.05M *potassium iodate VS* is equivalent to 33.64 mg of $C_{17}H_{38}BrN$.

STORAGE

Ph Eur

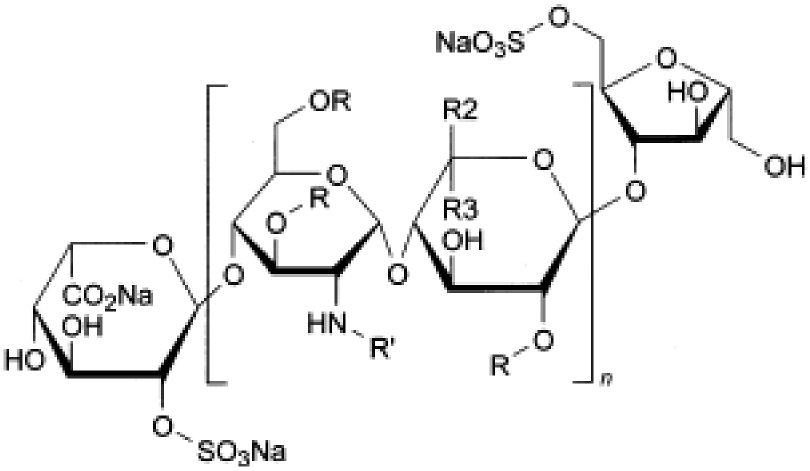
Dalteparin Sodium

General Notices

(Ph Eur monograph 1195)



Action and use

Low molecular weight heparin.

Ph Eur

DEFINITION

Dalteparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by nitrous acid depolymerisation of heparin from porcine intestinal mucosa. The majority of the components have a 2-*O*-sulpho-α-L-idopyranosuronic acid structure at the non-reducing end and a 6-*O*-sulpho-2,5-anhydro-D-mannitol structure at the reducing end of their chain.

Dalteparin sodium complies with the monograph Low-molecular-mass heparins (0828) with the modifications and additional requirements below.

The mass-average relative molecular mass ranges between 5600 and 6400, with a characteristic value of about 6000.

The degree of sulphatation is 2.0 to 2.5 per disaccharide unit.

The potency is not less than 110 IU and not more than 210 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The anti-factor IIa activity is not less than 35 IU/mg and not more than 100 IU/mg, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 1.9 and 3.2.

PRODUCTION

Dalteparin sodium is produced by a validated manufacturing and purification procedure under conditions designed to minimise the presence of N-NO groups.

The manufacturing procedure must have been shown to reduce any contamination by N-NO groups to approved limits using an appropriate, validated quantification method.

IDENTIFICATION

Carry out identification test A as described in the monograph *Low-molecular-mass heparins (0828)* using *dalteparin sodium CRS*.

Carry out identification test C as described in the monograph *Low-molecular-mass heparins (0828)*. The following requirements apply.

The mass-average relative molecular mass ranges between 5600 and 6400. The mass percentage of chains lower than 3000 is not more than 13.0 per cent. The mass percentage of chains higher than 8000 ranges between 15.0 per cent and 25.0 per cent.

TESTS

Appearance of solution

Dissolve 1 g in 10 ml of *water R*. The solution is clear *(2.2.1)* and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour *(2.2.2, Method II)*.

Nitrite

Not more than 5 ppm. Examine by liquid chromatography *(2.2.29)*. *Rinse all volumetric flasks at least three times with water R before the preparation of the solutions.*

Test solution Dissolve 80.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent. Allow to stand for at least 30 min.

Reference solution (a) Dissolve 60.0 mg of *sodium nitrite R* in *water R* and dilute to 1000.0 ml with the same solvent.

For the preparation of reference solution (b), use a pipette previously rinsed with reference solution (a).

Reference solution (b)

Dilute 1.00 ml of reference solution (a) to 50.0 ml with *water R*.

Before preparing reference solutions (c), (d) and (e), rinse all pipettes with reference solution (b).

Reference solution (c) Dilute 1.00 ml of reference solution (b) to 100.0 ml with *water R* (corresponding to 1 ppm of nitrite in the test sample).

Reference solution (d) Dilute 3.00 ml of reference solution (b) to 100.0 ml with *water R* (corresponding to 3 ppm of nitrite in the test sample).

Reference solution (e) Dilute 5.00 ml of reference solution (b) to 100.0 ml with *water R* (corresponding to 5 ppm of nitrite in the test sample).

The chromatographic procedure may be carried out using:

— a column 0.125 m long and 4.3 mm in internal diameter packed with a strong anion-exchange resin;

— as mobile phase at a flow rate of 1.0 ml/min a solution consisting of 13.61 g of *sodium acetate R* dissolved in *water R*, adjusted to pH 4.3 with *phosphoric acid R* and diluted to 1000 ml with *water R*;

— as detector an appropriate electrochemical device with the following characteristics and settings: a suitable working electrode, a detector potential of + 1.00 V versus Ag/AgCl reference electrode and a detector sensitivity of 0.1 µA full scale.

Inject 100 µl of reference solution (d). When the chromatograms are recorded in the prescribed conditions, the retention time for nitrite is 3.3 to 4.0 min. The test is not valid unless:

— the number of theoretical plates calculated for the nitrite peak is at least 7000 per metre per column (dalteparin sodium will block the binding sites of the stationary phase, which will cause shorter retention times and lower separation efficiency for the analyte; the initial performance of the column may be partially restored using a 58 g/l solution of *sodium chloride R* at a flow rate of 1.0 ml/min for 1 h; after regeneration the column is rinsed with 200 ml to 400 ml of *water R*);

— the symmetry factor for the nitrite peak is less than 3;

— the relative standard deviation of the peak area for nitrite obtained from 6 injections is less than 3.0 per cent.

Inject 100 µl each of reference solutions (c) and (e). The test is not valid unless:

— the correlation factor for a linear relationship between concentration and response for reference solutions (c), (d) and (e) is at least 0.995;

— the signal-to-noise ratio for reference solution (c) is not less than 5 (if the noise level is too high, electrode recalibration is recommended);

— a blank injection of *water R* does not give rise to spurious peaks.

Inject 100 µl of the test solution. Calculate the content of nitrite from the peak areas in the chromatogram obtained with reference solutions (c), (d) and (e).

Boron

Not more than 1 ppm, determined by inductively coupled plasma atomic emission spectroscopy.

Boron is determined by measurement of the emission from an inductively coupled plasma (ICP) at a wavelength specific to boron. The emission line at 249.733 nm is used. Use an appropriate apparatus, whose settings have been optimised as directed by the manufacturer.

Test solution Dissolve 0.2500 g of the substance to be examined in about 2 ml of *water for chromatography R*, add 100 µl of *nitric acid R* and dilute to 10.00 ml with the same solvent.

Reference solution (a) Prepare a 1 per cent V/V solution of *nitric acid R* in *water for chromatography R* (blank).

Reference solution (b) Prepare a 11.4 µg/ml solution of *boric acid R* in a 1 per cent *V/V* solution of *nitric acid R* in *water for chromatography R* (STD_{cal}).

Reference solution (c) Dissolve 0.2500 g of a reference dalteparin sodium with no detectable boron in about 2 ml of *water for chromatography R*, add 100 µl of *nitric acid R* and dilute to 10.00 ml with the same solvent (STD_0).

Reference solution (d) Dissolve 0.2500 g of a reference dalteparin sodium with no boron detected in about 2 ml of a 1 per cent *V/V* solution of *nitric acid R* in *water for chromatography*

R, add 10 µl of a 5.7 mg/ml solution of *boric acid R* and dilute to 10.00 ml with the same solvent (STD_1). This solution contains 1 µg/ml of boron.

Calculate the content of boron in the substance to be examined, using the following correction factor:

$$f = \frac{(STD_1 - STD_0) \times 2}{(STD_{cal} - blank)}$$

Loss on drying ***(2.2.32)***

Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Action and use

Heparinoid; prevention of deep vein thrombosis.

Ph Eur

DEFINITION

Preparation containing the sodium salts of a mixture of sulphated glycosaminoglycans present in porcine tissues. Its major constituents are heparan sulphate and dermatan sulphate. On complete hydrolysis it liberates D-glucosamine, D-galactosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulphuric acid. It has the characteristic property of enhancing the inactivation of activated factor X (factor Xa) by antithrombin. It has a negligible effect on the inactivation rate of thrombin by antithrombin.

Potency

11.0 to 17.0 anti-factor Xa units per milligram (dried substance).

PRODUCTION

Danaparoid sodium is prepared from the intestinal mucosa of pigs. It is prepared using a process that ensures that the relative proportion of active sulphated glycosaminoglycans is consistent. It is produced by methods of manufacturing designed to minimise or eliminate endotoxins and hypotensive substances.

IDENTIFICATION

First identification *B, E.*

Second identification *A, C, D, E.*

A. Dissolve about 10 mg in *water R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *water R*. Examined between 230 nm and 350 nm *(2.2.25)*, the solution shows 2 absorption maxima, at 240 nm and 326 nm and a shoulder at 336 nm. The ratio of the absorbance measured at the maximum at 240 nm to that measured at the maximum at 326 nm is 1.56 to 1.80 and the ratio of the absorbance measured at the maximum at 326 nm to that measured at the shoulder at 336 nm is 1.12 to 1.30.

B. Examine by infrared absorption spectrophotometry between 600 cm^{-1} and 2000 cm^{-1}

(2.2.24), comparing with the spectrum obtained with *dequalinium chloride CRS*.

C. To 5 ml of solution S (see Tests) add 5 ml of *potassium ferricyanide solution R*. A yellow precipitate is formed.

D. To 10 ml of solution S add 1 ml of *dilute nitric acid R*. A white precipitate is formed. Filter and reserve the filtrate for identification test E.

E. The filtrate from identification test D gives reaction (a) of chlorides *(2.3.1)*.

TESTS

Solution S

Dissolve 0.2 g in 90 ml of *carbon dioxide-free water R*, heating if necessary, and dilute to 100 ml with the same solvent.

Appearance of solution

Solution S is clear *(2.2.1)* and colourless *(2.2.2, Method II)*.

Acidity or alkalinity

To 5 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Related substances

Test solution Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a) Dissolve 10.0 mg of *dequalinium chloride for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b) Dissolve 10.0 mg of *dequalinium chloride CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with an *end-capped octadecylsilyl silica gel for chromatography R*,

— as mobile phase at a flow rate of 1.5 ml/min the following solution: dissolve 2 g of *sodium hexanesulphonate R* in 300 ml of *water R*. Adjust to pH 4.0 with *acetic acid R* and add 700 ml of *methanol R*,

— as detector a spectrophotometer set at 240 nm.

Adjust the sensitivity of the system so that the height of the peak due to impurity B in the chromatogram obtained with 10 µl of reference solution (a) is at least 25 per cent of the full scale of the recorder. Measure the height *(A)* above the baseline of the peak due to impurity B and the height *(B)* above the baseline at the lowest point of the curve separating this peak from the peak due to dequalinium chloride. The test is not valid unless *A* is greater than twice *B*. If necessary, adjust the concentration of methanol in the mobile phase.

Inject 10 µl of the test solution and 10 µl of reference solution (b). Continue the chromatography of the test solution for 5 times the retention time of the peak due to dequalinium chloride. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); and the sum of the areas of all the peaks, apart from the principal peak, is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (10 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

Detection B Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

Results B The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a).

System suitability Reference solution (b):

— the chromatogram shows 2 spots which may, however, not be completely separated.

D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a faint yellowish-brown colour develops. Add this solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains.

E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

F. To 40 mg add 2 ml of *sulphuric acid R* and heat gently until white fumes are evolved, add *nitric acid R* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water R*, heat until white fumes are again evolved, cool, add 10 ml of *water R* and neutralise to *red litmus paper R* with *dilute ammonia R1*. The solution gives reaction (a) of sodium *(2.3.1)* and reaction (b) of phosphates *(2.3.1)*.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Molecular-mass distribution

Size-exclusion chromatography *(2.2.30)*.

Test solution Dissolve 6.0-6.5 mg of the substance to be examined in 1.0 ml of the mobile phase.

Reference solution (a) Dissolve 6.0-6.5 mg of *dextran 1 CRS* in 1.0 ml of the mobile phase.

Reference solution (b) Dissolve the content of an ampoule of *isomaltooligosaccharide CRS* in 1 ml of the mobile phase, and mix. This corresponds to approximately 45 µg of isomaltotriose (3 glucose units), approximately 45 µg of isomaltononaose (9 glucose units), and approximately 60 µg of sodium chloride per 100 µl.

Column 2 columns coupled in series:

— *size:* l = 0.30 m, Ø = 10 mm,

— *stationary phase*: dextran covalently bound to highly cross-linked porous agarose beads, allowing resolution of oligosaccharides in the molecular mass range of 180 to 3000,

— *temperature*: 20-25 °C.

Mobile phase 2.92 g/l solution of *sodium chloride R*.

Flow rate 0.07-0.08 ml/min maintained constant to ± 1 per cent.

Detection Differential refractometer.

Injection 100 µl.

Identification of peaks Use the chromatogram obtained with reference solution (b) to identify the peaks due to isomaltotriose, isomaltononaose and sodium chloride.

Determine the peak areas. Disregard any peak due to sodium chloride. Calculate the average relative molecular mass M_w and the amount of the fraction with less than 3 and more than 9 glucose units, of *dextran 1 CRS* and of the substance to be examined, using the following expression:

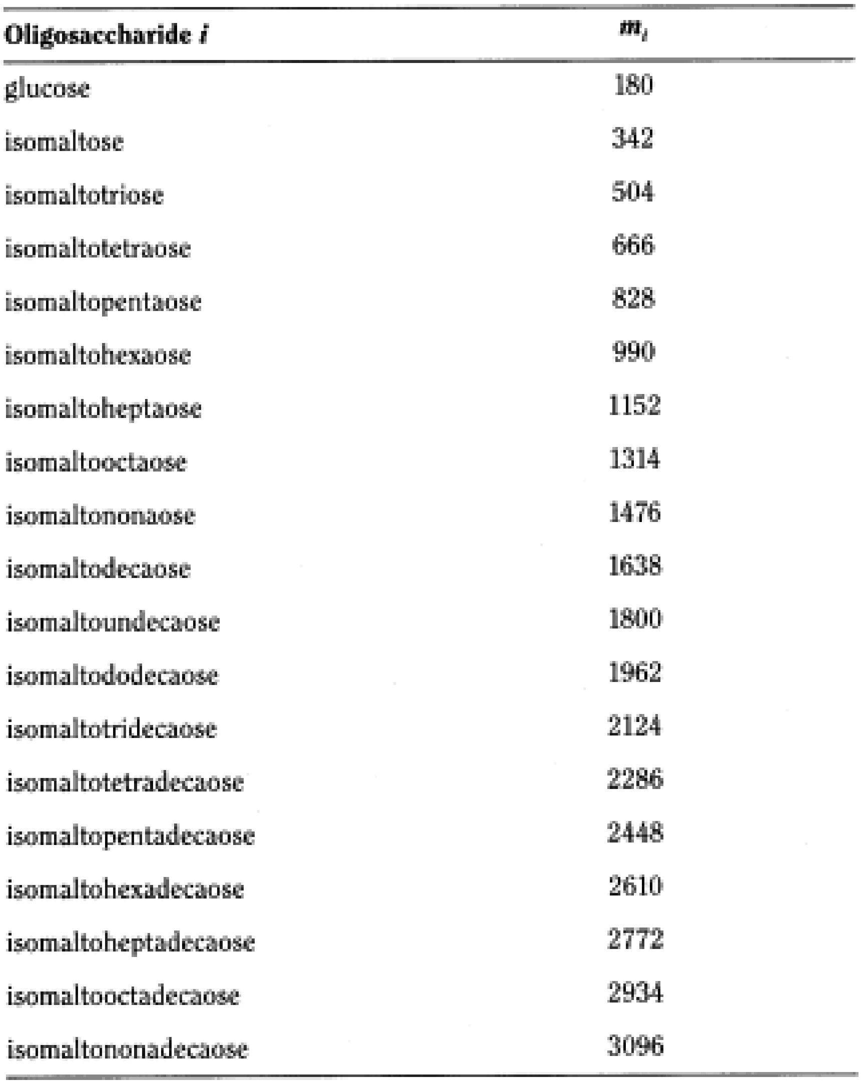
$$M_w = \sum w_i \times m_i$$

M_w = average molecular mass of the dextran,

m_i = molecular mass of oligosaccharide *i*,

w_i = weight proportion of oligosaccharide *i*.

Use the following m_i values for the calculation:



Oligosaccharide i	m_i
glucose	180
isomaltose	342
isomaltotriose	504
isomaltotetraose	666
isomaltopentaose	828
isomaltohexaose	990
isomaltoheptaose	1152
isomaltooctaose	1314
isomaltononaose	1476
isomaltodecaose	1638
isomaltoundecaose	1800

isomaltohexadecaose	2610
isomaltoheptadecaose	2772
isomaltooctadecaose	2934

Preparation

Dextropropoxyphene Capsules

DEFINITION

Dextropropoxyphene Napsilate is (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1phenylpropyl propionate naphthalene-2-sulphonate monohydrate. It contains not less than 98.0% and not more than 101.0% of $C_{22}H_{29}NO_2,C_{10}H_8O_3S$, calculated with reference to the anhydrous substance.

CHARACTERISTICS

A white powder. It exhibits polymorphism.

Practically insoluble in *water*; soluble in *ethanol (96%)*.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of dextropropoxyphene napsilate *(RS 092)*. If the spectra are not concordant, dissolve a sufficient quantity in the minimum volume of *dichloromethane IR*, evaporate to dryness, dry the residue at 105° for 1 hour and prepare a new spectrum.

B. Dissolve 25 mg in 5 ml of *dichloromethane*, evaporate 0.05 ml of the solution in a porcelain dish and streak the spot with *sulphuric acid* containing 5% v/v of *formaldehyde solution*. A purple colour is produced.

C. Burn 20 mg by the method for *oxygen-flask combustion*, Appendix VIII C, using 5 ml of 1.25M *sodium hydroxide* as the absorbing liquid. When the process is complete, dilute the liquid to 25 ml with *water*. To 5 ml of the solution so obtained add 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of 1M *hydrochloric acid*, mix and add 0.05 ml of *barium chloride solution*. The solution becomes turbid.

TESTS

In the chromatogram obtained with solution (3) the ratio of the area of any peak corresponding to (b) to that of the peak due to (a) and the ratio of the area of any peak corresponding to (c) to that of the peak due to (a) are not greater than the corresponding ratios in the chromato-gram obtained with solution (1) (0.67% each).

After removal of the plate, dry it in a stream of warm air for 10 minutes. Spray with *ninhydrin solution* and heat at 110° for 15 minutes. The two principal spots in the chromatogram obtained with solution (1) are similar in position, colour and size to the corresponding spots in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH of a 1% w/v solution in *ethanol (10%)*, 6.4 to 8.4, Appendix V L.

Clarity and colour of solution

A 5% w/v solution in *methanol* is *clear*, Appendix IV A. The *absorbance* of the solution measured at 440 nm is not greater than 0.05, Appendix II B.

Heavy metals

2 g complies with *limit test C for heavy metals*, Appendix VII. Use 2 ml of *lead standard solution (10 ppm Pb)* to prepare the standard (10 ppm).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.10% w/v of the substance being examined in the mobile phase. For solution (2) dilute 2 volumes of solution (1) to 100 volumes with the mobile phase and dilute 1 volume of this solution to 10 volumes with the same solvent. For solution (3) dissolve 1 mg of *diclofenac impurity A EPCRS* in the mobile phase, add 1 ml of solution (1) and dilute to 200 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (end-capped Zorbax C8 is suitable), (b) as the mobile phase at a flow rate of 1 ml per minute a mixture of 34 volumes of a mixture of equal volumes of a 0.1% w/v solution of *orthophosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate* adjusted to pH 2.5 and 66 volumes of *methanol* and (c) a detection wavelength of 254 nm.

Inject 20 µl of solution (3). When the chromatograms are recorded in the prescribed conditions, the retention times are about 25 minutes for diclofenac and about 12 minutes for diclofenac impurity A. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained with solution (3) is not less than 50% of the full scale of the recorder. Continue the chromatography for 1.5 times the retention time of diclofenac. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 6.5.

Inject 20 µl of solution (1) and 20 µl of solution (2). In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Loss on drying

When dried at a pressure not exceeding 1 kPa for 24 hours, loses not more than 0.5% of its weight. Use 1 g.

Sulphated ash

Not more than 0.1%, Appendix IX A, Method II. Use 1 g.

ASSAY

Dissolve 0.5 g in 30 ml of *anhydrous acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, determining the end point potentiometrically. Each ml of 0.1M *perchloric acid VS* is equivalent to 36.93 mg of $C_{18}H_{22}Cl_2N_2O_2$.

Acetate buffer solution pH 5.2 Dissolve 10 g of *sodium acetate R* in 100 ml of *water R* and add 10 ml of *dilute acetic acid R*. Dilute to 500 ml with *water R* and adjust to pH 5.2 ± 0.1.

Test solution (a) Considering the labelled content, transfer an accurately weighed quantity corresponding to about 2 mg of conjugated estrogens to a 50 ml centrifuge tube containing 15 ml of the acetate buffer solution pH 5.2 and 1 g of *barium chloride R*. Cap the tube tightly and shake for 30 min. If necessary, adjust to pH 5.0 ± 0.5 with *acetic acid R* or a 120 g/l solution of *sodium acetate R*. Sonicate for 30 s, then shake for 30 min. Add a suitable sulphatase preparation equivalent to 2500 units and shake mechanically for 10 min in a water-bath at 50 ± 1 °C. Swirl the tube by hand, then shake mechanically for 10 min in the water-bath. Allow to cool. Add 15.0 ml of *ethylene chloride R* to the mixture, immediately cap the tube tightly and shake for 15 min. Centrifuge for 10 min or until the lower layer is clear. Draw out the organic layer to a screw-cap tube, add 5 g of *anhydrous sodium sulphate R* and shake. Allow the solution to stand until clear. Protect the solution from any loss due to evaporation. Transfer 3.0 ml of the clear solution to a suitable centrifuge tube fitted with a screw cap. Add 1.0 ml of the internal standard solution. Evaporate the mixture to dryness with the aid of a stream of *nitrogen R*, maintaining the temperature below 50 °C. To the dry residue add 15 µl of *anhydrous pyridine R* and 65 µl of *N,O-bis(trimethylsilyl)trifluoroacetamide R* containing 1 per cent of *chlorotrimethylsilane R*. Immediately cap the tube tightly, mix thoroughly and allow to stand for 15 min. Add 0.5 ml of *toluene R* and mix mechanically.

Test solution (b) Prepare as described in test solution (a), but do not add the sulphatase and use 6.0 ml of the upper layer instead of 3.0 ml. Prepare a blank in the same manner.

Reference solution (a) Dissolve separately 8 mg of *estrone CRS*, 7 mg of *equilin CRS* and 5 mg of *17α-dihydroequilin CRS* in 10.0 ml of *anhydrous ethanol R*. Dilute together 2.0 ml, 1.0 ml and 1.0 ml respectively of these solutions to 10.0 ml with *anhydrous ethanol R*. Transfer 1.0 ml of this solution and 1.0 ml of the internal standard solution to a centrifuge tube fitted with a screw cap. Evaporate the mixture to dryness with the aid of a stream of *nitrogen R*, maintaining the temperature below 50 °C. To the dry residue add 15 µl of *anhydrous pyridine R* and 65 µl of *N,O-bis(trimethylsilyl)trifluoroacetamide R* containing 1 per cent of *chlorotrimethylsilane R*. Immediately cap the tube tightly, mix and allow to stand for 15 min. Add 0.5 ml of *toluene R*.

Reference solution (b) Prepare as described in reference solution (a), but dilute tenfold with *anhydrous ethanol R* before adding the internal standard.

DEFINITION

Enoxaparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by alkaline depolymerisation of the benzyl ester derivative of heparin from porcine intestinal mucosa. Enoxaparin consists of a complex set of oligosaccharides that have not yet been completely characterised. Based on current knowledge, the majority of the components have a 4-enopyranose uronate structure at the non-reducing end of their chain. 15 per cent to 25 per cent of the components have a 1,6-anhydro structure at the reducing end of their chain.

Enoxaparin sodium complies with the monograph Low-molecular-mass heparins (0828) with the modifications and additional requirements below.

The mass-average relative molecular mass ranges between 3800 and 5000, with a characteristic value of about 4500.

The degree of sulphatation is about 2 per disaccharide unit.

The potency is not less than 90 IU and not more than 125 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The anti-factor IIa activity is not less than 20.0 IU and not more than 35.0 IU per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 3.3 and 5.3.

PRODUCTION

Enoxaparin is produced by alkaline depolymerisation of benzyl ester derivatives of heparin from porcine intestinal mucosa under conditions that yield a product complying with the structural requirements stated under Definition.

IDENTIFICATION

Carry out identification test A as described in the monograph *Low-molecular-mass heparins (0828)* using *enoxaparin sodium CRS*.

Carry out identification test C as described in the monograph *Low-molecular-mass heparins (0828)*. The following requirements apply.

The mass-average relative molecular mass ranges between 3800 and 5000. The mass percentage of chains lower than 2000 ranges between 12.0 per cent and 20.0 per cent. The mass percentage of chains between 2000 and 8000 ranges between 68.0 per cent and 82.0 per cent.

DEFINITION

Ergocalciferol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of (5*Z*,7*E*,22*E*)-9,10-secoergosta-5,7,10(19),22-tetraen-3β-ol.

1 mg of ergocalciferol is equivalent to 40 000 IU of antirachitic activity (vitamin D) in rats.

CHARACTERS

A white or slightly yellowish, crystalline powder or white or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light. Solutions in volatile solvents are unstable and are to be used immediately.

A reversible isomerisation to pre-ergocalciferol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

Examine by infrared absorption spectrophotometry *(2.2.24)*, comparing with the spectrum obtained with *ergocalciferol CRS*. Examine the substances prepared as discs.

TESTS

Specific optical rotation *(2.2.7)*

Dissolve 0.200 g rapidly and without heating in *aldehyde-free alcohol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation, determined within 30 min of preparing the solution, is + 103 to + 107.

Reducing substances

Dissolve 0.1 g in *aldehyde-free alcohol R* and dilute to 10.0 ml with the same solvent. Add 0.5 ml of a 5 g/l solution of *tetrazolium blue R* in *aldehyde-free alcohol R* and 0.5 ml of *dilute tetramethylammonium hydroxide solution R*. Allow to stand for exactly 5 min and add 1.0 ml of *glacial acetic acid R*. Prepare a reference solution at the same time and in the same manner using 10.0 ml of a solution containing 0.2 µg/ml of *hydroquinone R* in aldehyde*-free alcohol R*. Measure the absorbance *(2.2.25)* of the two solutions at 525 nm using as the compensation liquid 10.0 ml of *aldehyde-free alcohol R* treated in the same manner. The absorbance of the test solution is not greater than that of the reference solution (20 ppm).

Ergosterol

Examine by thin-layer chromatography *(2.2.27)*, using a *TLC silica gel G plate R*.

Test solution Dissolve 0.25 g of the substance to be examined in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 5 ml with the same solvent. Prepare immediately before use.

Reference solution (a) Dissolve 0.10 g of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 2 ml with the same solvent. Prepare immediately before use.

Reference solution (b) Dissolve 5 mg of *ergosterol CRS* in *ethylene chloride R* containing 10 g/l of *squalane R* and 0.1 g/l of *butylhydroxytoluene R* and dilute to 50 ml with the same solvent. Prepare immediately before use.

Reference solution (c) Mix equal volumes of reference solution (a) and reference solution (b) . Prepare immediately before use.

Apply to the plate 10 µl of the test solution, 10 µl of reference solution (a), 10 µl of reference solution (b) and 20 µl of reference solution (c). Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/l of *butylhydroxytoluene R*. Allow the plate to dry in air and spray three times with *antimony trichloride solution R1*. Examine the chromatograms for 3 min to 4 min after spraying. The principal spot in the chromatogram obtained with the test solution is initially orange-yellow and then becomes brown. In the chromatogram obtained with the test solution, any slowly appearing violet spot (corresponding to ergosterol) immediately below the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). There is no spot in the chromatogram obtained with the test solution that does not correspond to one of the spots in the chromatograms obtained with reference solutions (a) and (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

ASSAY

Carry out the operations as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography *(2.2.29)*.

Test solution Dissolve 10.0 mg of the substance to be examined without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a) Dissolve 10.0 mg of *ergocalciferol CRS* without heating in 10.0 ml of *toluene R* and dilute to 100.0 ml with the mobile phase.

Reference solution (b) Dilute 1.0 ml of *cholecalciferol for performance test CRS* to 5.0 ml with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),

— as mobile phase at a flow rate of 2 ml/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,

— as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks corresponding to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the percentage content of ergocalciferol from the expression:

$$\frac{m'}{m} \times \frac{S_D}{S'_D} \times 100$$

m = mass of the substance to be examined in the test solution, in milligrams,

m' = mass of *ergocalciferol CRS* in reference solution (a), in milligrams,

S_D = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with the test solution,

S'_D = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with reference solution (a).

The contents of an opened container are to be used immediately.

Ergotamine tartrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of bis[(6a*R*,9*R*)-*N*-[(2*R*,5*S*,10a*S*,10b*S*)-5-benzyl-10b-hydroxy-2-methyl-3,6-dioxo-octahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide] tartrate, calculated with reference to the dried substance. It may contain two molecules of methanol of crystallisation.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, slightly hygroscopic, slightly soluble in alcohol. Aqueous solutions slowly become cloudy owing to hydrolysis; this may be prevented by the addition of tartaric acid.

IDENTIFICATION

First identification B, C.

Second identification A, C, D, E.

A. Dissolve 50 mg in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with *0.01 M hydrochloric acid*. Examined between 250 nm and 360 nm *(2.2.25)*, the solution shows an absorption maximum at 311 nm to 321 nm and a minimum at 265 nm to 275 nm. The specific absorbance at the maximum is 118 to 128, calculated with reference to the dried substance.

B. Examine by infrared absorption spectrophotometry *(2.2.24)*, comparing with the spectrum obtained with *ergotamine tartrate CRS*. Examine the substances as discs prepared as follows: triturate the substance to be examined and the reference substance separately with 0.2 ml of *methanol R* and then with *potassium bromide R* as prescribed in the general method.

C. Examine for not more than 1 min in ultraviolet light at 365 nm the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and fluorescence to the principal spot in the chromatogram obtained with reference solution (a). After spraying with *dimethylaminobenzaldehyde solution R7*, examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 0.1 ml of solution S (see Tests) add 1 ml of *glacial acetic acid R*, 0.05 ml of *ferric chloride solution R1* and 1 ml of *phosphoric acid R* and heat in a water-bath at 80 °C. After about 10 min, a blue or violet colour develops which becomes more intense on standing.

E. Dissolve about 10 mg in 1.0 ml of *0.1 M sodium hydroxide*. Transfer to a separating funnel and shake with 5 ml of *methylene chloride R*. Discard the organic layer. Neutralise the aqueous layer with a few drops of *dilute hydrochloric acid R*. 0.1 ml of this solution gives reaction (b) of tartrates *(2.3.1)*. Pour the reaction mixture into 1 ml of *water R* to observe the colour change to red or brownish-red.

TESTS

Carry out all operations as rapidly as possible, protected from light.

Solution S

Triturate 30 mg finely with about 15 mg of *tartaric acid R* and dissolve with shaking in 6 ml of *water R*.

Appearance of solution

Solution S is clear *(2.2.1)* and not more intensely coloured than reference solution Y_6 *(2.2.2, Method II)*.

pH *(2.2.3)*

Shake 10 mg, finely powdered, with 4 ml of *carbon dioxide-free water R*. The pH of the suspension is 4.0 to 5.5.

Specific optical rotation *(2.2.7)*

Dissolve 0.40 g in 40 ml of a 10 g/l solution of *tartaric acid R*. Add 0.5 g of *sodium hydrogen carbonate R* cautiously in several portions and mix thoroughly. Shake with four quantities, each of 10 ml, of *chloroform R* previously washed with five quantities of *water R*, each of 50 ml per 100 ml of *chloroform R*. Combine the organic layers. Filter through a small filter moistened with *chloroform R* previously washed as described above. Dilute the filtrate to 50.0 ml with *chloroform R* previously washed as described above. Measure the angle of rotation.

Determine the amount of ergotamine base in the chloroformic solution as follows: to 25.0 ml of the solution add 50 ml of *anhydrous acetic acid R* and titrate with *0.05 M perchloric acid*, determining the end-point potentiometrically *(2.2.20)*.

1 ml of *0.05 M perchloric acid* is equivalent to 29.08 mg of $C_{33}H_{35}N_5O_5$.

The specific optical rotation is - 154 to - 165, calculated from the angle of rotation and the concentration of ergotamine base.

Develop immediately over a path of 17 cm using a mixture of 5 volumes of *ethanol R*, 10 volumes of *methylene chloride R*, 15 volumes of *dimethylformamide R* and 70 volumes of *ether R*. Dry the plate in a current of cold air for about 2 min. Examine for not more than 1 min in ultraviolet light at 365 nm for the identification. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (1.5 per cent) and at most one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Ph Eur

DEFINITION

Erythropoietin concentrated solution is a solution containing a family of closely-related glycoproteins which are indistinguishable from the naturally occurring human erythropoietin (urinary erythropoietin) in terms of amino acid sequence (165 amino acids) and average glycosylation pattern, at a concentration of 0.5-10 mg/ml. It may also contain buffer salts and other excipients. It has a potency of not less than 100 000 IU/mg of active substance determined using the conditions described under Assay and in the test for protein.

PRODUCTION

Erythropoietin is produced in rodent cells *in vitro* by a method based on recombinant DNA technology.

Prior to batch release, the following tests are carried out on each batch of the final product, unless exemption has been granted by the competent authority.

Host cell-derived proteins

The limit is approved by the competent authority.

Host cell- and vector-derived DNA

The limit is approved by the competent authority.

CHARACTERS

Appearance

Clear or slightly turbid, colourless solution.

IDENTIFICATION

A. It gives the appropriate response when examined using the conditions described under Assay.

B. Capillary zone electrophoresis *(2.2.47)*.

Test solution Dilute the preparation to be examined with *water R* to obtain a concentration of 1 mg/ml. Desalt 0.25 ml of the solution by passage through a micro-concentrator cartridge provided with a membrane with a molecular mass cut-off of not more than 10 000 Da. Add 0.2 ml of *water R* to the sample and desalt again. Repeat the desalting procedure once more. Dilute the sample with *water R*, determine its protein concentration as described under Tests and adjust to a concentration of approximately 1 mg/ml with *water R*.

Reference solution Dissolve the contents of a vial of *erythropoietin BRP* in 0.25 ml of *water R*. Proceed with desalting as described for the test solution.

System suitability In the electropherogram obtained with the reference solution, a pattern of well separated peaks corresponding to the peaks in the electropherogram of erythropoietin supplied with *erythropoietin BRP* is seen, and the largest peak is at least 50 times greater than the baseline noise. If necessary, adjust the sample load to give peaks of sufficient height. Identify the peaks due to isoforms 1 to 8. Isoform 1 may not be visible. The peak due to isoform 8 is detected and the resolution between the peaks due to isoforms 5 and 6 is not less than 1. Repeat the separation at least 3 times. The baseline is stable, showing little drift, and the distribution of peaks is qualitatively and quantitatively similar to the distribution of peaks in the electropherogram of erythropoietin supplied with *erythropoietin BRP*. The relative standard deviation of the migration time of the peak due to isoform 2 is less than 2 per cent.

Limits Identify the peaks due to isoforms 1 to 8 in the electropherogram obtained with the test solution by comparison with the electropherogram obtained with the reference solution. Calculate the percentage content of each isoform from the corresponding peak area. The percentages are within the following ranges:

Isoform	Content (per cent)
1	0 - 15
2	0 - 15
3	1 - 20
4	10 - 35
5	15 - 40
6	10 - 35
7	5 - 25
8	0 - 15

ASSAY

The activity of the preparation is compared with that of *erythropoietin BRP* and expressed in International Units (IU).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits of the estimated potency ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

Carry out the determination of potency by Method A or B.

A. In polycythaemic mice

The activity of the preparation is estimated by examining, under given conditions, its effect in stimulating the incorporation of ^{59}Fe into circulating red blood cells of mice made polycythaemic by exposure to reduced atmospheric pressure.

The following schedule, using treatment in a hypobaric chamber, has been found to be suitable.

Induce polycythaemia in female mice of the same strain, weighing 16-18 g. Place the mice in a hypoxic chamber and reduce the pressure to 0.6 atmospheres. After 3 days at 0.6 atmospheres, further reduce the pressure to 0.4-0.5 atmospheres and maintain the animals at this pressure for a further 11 days (the partial vacuum is interrupted daily for a maximum of 1 h at about 11:00 a.m., in order to clean the cages and feed the animals). At the end of the specified period, return the mice to normal atmospheric conditions. Randomly distribute the mice into cages, each containing 6 animals, and mark them.

Test solution (a) Dilute the substance to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/ml.

Test solution (b) Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Test solution (c) Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (a) Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/ml.

Reference solution (b) Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (c) Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Radiolabelled ferric [^{59}Fe] chloride solution, concentrated Use a commercially available solution of [^{59}Fe]ferric chloride (approximate specific activity: 100-1000 MBq/mg of Fe).

Radiolabelled [^{59}Fe]ferric chloride solution Dilute the concentrated radiolabelled [^{59}Fe]ferric chloride solution in *sodium citrate buffer solution pH 7.8 R* to obtain a solution with an activity of 3.7×10^4 Bq/ml.

The concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

3 days after returning the animals to atmospheric pressure, inject each animal subcutaneously with 0.2 ml of one of the solutions. The 6 animals in each cage must each receive one of the 6 different treatments (3 test solutions and 3 reference solutions), and the

order of injection must be separately randomised for each cage. A minimum of 8 cages is recommended. 2 days after injection of the test or reference solution, inject each animal intraperitoneally with 0.2 ml of radiolabelled [^{59}Fe]ferric chloride solution. The order of the injections must be the same as that of the erythropoietin injections, and the time interval between administration of the erythropoietin and the radiolabelled ferric chloride solution must be the same for each animal. After a further 48 h, anaesthetise each animal by injection of a suitable anaesthetic, record body weights and withdraw blood samples (0.65 ml) into haematocrit capillaries from the bifurcation of the aorta. After determining the packed cell volume for each sample, measure the radioactivity.

Calculate the response (percentage of iron-59 in total circulating blood) for each mouse using the expression:

$$\frac{A_s \times M \times 7.5}{A_t \times V_s}$$

A_s = radioactivity in the sample,

A_t = total radioactivity injected,

7.5 = total blood volume as per cent body weight,

M = body weight, in grams,

V_s = sample volume.

Calculate the potency by the usual statistical methods for a parallel line assay. Eliminate from the calculation any animal where the packed cell volume is less than 54 per cent, or where the body weight is more than 24 g.

B. In normocythaemic mice

The assay is based on the measurement of stimulation of reticulocyte production in normocythaemic mice.

The assay may be carried out using the following procedure:

Test solution (a) Dilute the preparation to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/ml.

Test solution (b) Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Test solution (c) Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (a) Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/ml.

Reference solution (b) Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (c) Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1.*

The exact concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

At the beginning of the assay procedure, randomly distribute mice of a suitable age and strain (8-week old B6D2F1 mice are suitable) into 6 cages. A minimum of 8 mice per cage is recommended. Inject each animal subcutaneously with 0.5 ml of the appropriate treatment (one solution per cage) and put the animal in a new cage. Combine the mice in such a way that each cage housing the treated mice contains one mouse out of the 6 different treatments (3 test solutions and 3 reference solutions, 6 mice per cage). 4 days after the injections, collect blood samples from the animals and determine the number of reticulocytes using a suitable procedure.

The following method may be employed:

The volume of blood, dilution procedure and fluorescent reagent may need to be modified to ensure maximum development and stability of fluorescence.

Colorant solution, concentrated Use a solution of thiazole orange suitable for the determination of reticulocytes. Prepare at a concentration twice that necessary for the analysis.

Proceed with the following dilution steps. Dilute whole blood 500-fold in the buffer used to prepare the colorant solution. Dilute this solution 2-fold in the concentrated colorant solution. After staining for 3-10 min, determine the reticulocyte count microfluorometrically in a flow cytometer. The percentage of reticulocytes is determined using a biparametric histogram: number of cells/red fluorescence (620 nm).

Calculate the potency by the usual statistical methods for a parallel line assay.

STORAGE

Any opalescence produced is not more intense than that obtained by treating a solution containing 13.4 µg of *sodium chloride* in 10 ml in the same manner (0.1%).

Estradiol 17β-phosphate

Dissolve 50 mg in 5 ml of 0.2M *sodium hydroxide*, add sufficient *ethanol (96%)* to produce 10 ml, mix and immediately measure the *absorbance* at the maxima at 300 nm and 350 nm, Appendix II B. The difference between the two absorbances is not more than 0.34 (1.0%).

Inorganic phosphate

Dissolve 25 mg in 10 ml of *water*, add 4 ml of 1M *sulphuric acid* , 1 ml of a 10% w/v solution of *ammonium molybdate* and 2 ml of *methylaminophenol-sulphite reagent* and allow to stand for 15 minutes. Add sufficient *water* to produce 25 ml, allow to stand for 15 minutes and filter. The *absorbance* of the filtrate at 730 nm, Appendix II B, is not greater than the *absorbance* at 730 nm of a solution obtained by repeating the operation using 10 ml of a 0.00180% w/v solution of *potassium dihydrogen orthophosphate* and beginning at the words 'add 4 ml of 1M *sulphuric acid* …'.

Volatile matter

Carry out the method for *gas chromatography*, Appendix III B, using solutions in *water* containing (1) 0.0040% v/v of *pyridine*, 0.020% v/v of *absolute ethanol* and 0.020% v/v of *butan-1-ol* (internal standard), (2) 4.0% w/v of the substance being examined and (3) 4.0% w/v of the substance being examined and 0.020% v/v of the internal standard.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 20% w/w of polyethylene glycol (Carbowax 20M is suitable) and maintained at 120°.

In the chromatogram obtained with solution (1) the area of the peak due to pyridine is greater than the area of any corresponding peak in the chromatogram obtained with solution (3). In the chromatogram obtained with solution (1) the area of the peak due to ethanol is greater than the sum of the areas of any peaks with a retention time less than that of the peak due to the internal standard in the chromatogram obtained with solution (3).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of equal volumes of *butan-2-one*, *propan-2-ol* and *triethylamine hydrogen carbonate solution* as the mobile phase. Apply separately to the plate 10 µl of each of four freshly prepared solutions in a mixture of 49 volumes of *methanol* and 1 volume of *triethylamine* containing (1) 4.0% w/v of the substance being examined, (2) 0.020% w/v of the substance being examined, (3) 0.080% w/v of *17β,17′β-bis3-[bis(2-chloroethyl) carbamoyloxy]estra1,3,5(10)-trienyl pyrophosphate BPCRS* and (4) 0.040% of *estramustine BPCRS*. After removal of the plate, allow it to dry in air, spray with *methanolic sulphuric acid (20%)* and heat at 110° for 10 minutes. The principal spots in the chromatograms obtained with solutions (3) and (4) are more intense than any corresponding spots in the chromatogram obtained with solution (1) (2 and 1% respectively). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Water

Not more than 5.0% w/w, Appendix IX C. Use 0.2 g.

ASSAY

To 0.5 g add 40 ml of 1M *sodium hydroxide* and boil under a reflux condenser for 60 minutes. Cool and transfer the mixture to a 250 ml graduated flask with the aid of *water*. Add 100 ml of 0.1M *silver nitrate VS* and 10 ml of *nitric acid*, dilute to 250 ml with *water* and mix. Filter and titrate the excess of silver nitrate in 50 ml of the filtrate with 0.1M *ammonium thiocyanate VS* using 3 ml of *ammonium iron(III) sulphate solution R2* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 28.22 mg of $C_{23}H_{30}Cl_2NNa_2O_6P$.

Prepare a 0.1% w/v solution of *3-aminopropan-1-ol* (internal standard) in *dichloromethane* (solution A). Carry out the method for *gas chromatography*, Appendix III B, using the following solutions prepared in suitable sealed reaction vials. For solution (1) prepare a solution containing 0.05% w/v of *ethanolamine* and 0.1% w/v each of *diethanolamine* and *triethanolamine* in solution A. To 0.5 ml of this solution add 0.5 ml of *trifluoroacetic anhydride*, mix and allow to stand for 10 minutes. For solution (2) prepare a 10% w/v solution of the substance being examined in solution A. To 0.5 ml of this solution add 0.5 ml of *trifluoroacetic anhydride*, mix and allow to stand for 10 minutes.

The chromatographic procedure may be carried out using (a) a fused silica capillary column (25 m × 0.22 mm) bonded with a 0.25-µm layer of dimethylpolysiloxane, (b) *helium* as the carrier gas at a flow rate of 1.0 ml per minute with a flow rate of the make up gas of 20 ml per minute and (c) a split injection system with a split ratio of 40 to 1 maintained at 240° and a detector temperature of 250°. Maintain the temperature of the column at 80° for 2 minutes, then increase to 200° at a rate of 8° per minute and maintain this temperature for 10 minutes.

In the chromatogram obtained with solution (1) the peaks eluting after the solvent peak in order of emergence are due to (a) ethanolamine, (b) 3-aminopropan-1-ol, (c) diethanolamine and (d) triethanolamine. In the chromatogram obtained with solution (2) calculate the content of diethanolamine and triethanolamine by reference to the corresponding peaks in the chromatogram obtained with solution (1). Calculate the content of any other impurity by reference to the peak due to ethanolamine in the chromatogram obtained with solution (1). The content of diethanolamine and triethanolamine is not more than 1.0% w/w of each, the content of any other impurity is not more than 0.5% w/w and the sum of the contents of all the impurities is not more than 2.0% w/w.

The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 272 nm and 278 nm, and a shoulder at 266 nm. The *absorbance* at the maximum at 272 nm is about 0.70 and at the maximum at 278 nm is about 0.65.

The test is not valid unless the *resolution factor* between the peaks corresponding to fenoprofen and 4,4′-dimethoxybenzophenone in the chromatogram obtained with solution (3) is at least 3.0.

In the chromatogram obtained with solution (2) the area of any *secondary peak* is not greater than twice the area of the peak in the chromatogram obtained with solution (1) (1%), not more than one such peak has an area greater than the area of the peak in the chromatogram obtained with solution (1) (0.5%) and the sum of the areas of all such peaks is not greater than four times the area of the peak in the chromatogram obtained with solution (1) (2%).

Add 57 ml of *glacial acetic acid R* and 200 ml of a 100 g/l solution of *cyclohexylenedinitrilotetra-acetic acid R* in *1 M sodium hydroxide*. Adjust the pH to 5.0 to 5.5 with a 200 g/l solution of *sodium hydroxide R* and dilute to 1000.0 ml with *water R*.

Test solution Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Prepare three reference solutions by dilution of solution (a) 1 in 100, 1 in 1000 and 1 in 10 000.

To 20.0 ml of each reference solution, add 10.0 ml of the buffer solution and stir with a magnetic stirrer.
